

Multiport Gigabit Ethernet Switches

GENERAL DESCRIPTION

The Broadcom® BCM53128 is a highly integrated, cost-effective unmanaged-smart gigabit switch. The switch design is based on the field-proven, industry-leading ROBO architecture. This device combines all the functions of a high-speed switch system including packet buffers, PHY transceivers, media access controllers (MACs), address management, port-based rate control, and a non-blocking switch fabric into a single 65-nm CMOS device. Designed to be fully compliant with the IEEE 802.3™ and IEEE 802.3x specifications, including the MAC-control PAUSE frame, the BCM53128 provides compatibility with all industry-standard Ethernet, Fast Ethernet, and Gigabit Ethernet (GbE) devices.

The BCM53128 has a rich feature set suitable for not only standard GbE connectivity for desktop and laptop PCs, but also for next-generation gaming consoles, set-top boxes, networked DVD players, and home theater receivers. It is also specifically designed for next generation SOHO/SMB routers and gateways.

The BCM53128 contains eight full-duplex 10/100/1000BASE-TX Ethernet transceivers.

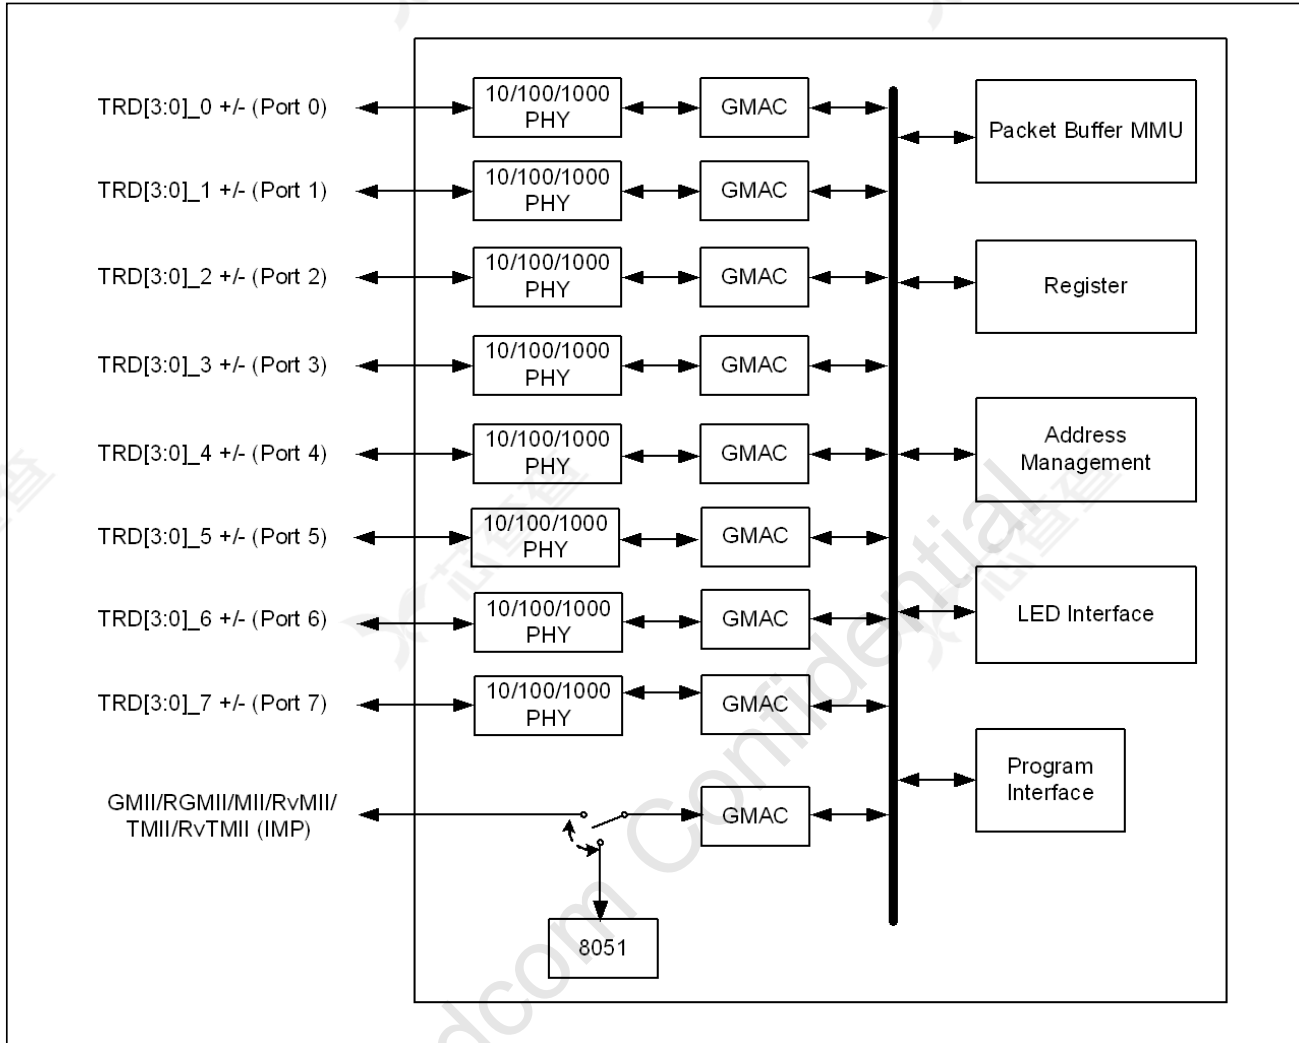

The BCM53128 provides 70+ on-chip MIB counters to collect receive and transmit statistics for each port.

The BCM53128 is available in commercial temperature (C-Temp) and industrial temperature (I-Temp) rated packages. The BCM53128 is provided in a 256-pin eLQFP (28 mm x 28 mm) package.

FEATURES

- Nine 10/100/1000 media access controllers
- Eight port 10/100/1000BASE-T/Tx transceivers
- One GMII/RGMII/MII/RvMII/TMII/RvTMII interface for an in-band management port (IMP) for connection to a CPU/management entity without PHY
- IEEE 802.1p, MAC, Port, TOS, and DiffServ QoS for four queues, plus two time sensitive queues
- Port-based VLAN
- IEEE 802.1Q-based VLAN with 4K entries
- MAC-based trunking with automatic link failover
- Port-based rate control
- Port mirroring
- BroadSync® HD for IEEE 802.1AS support
 - Timestamp tagging at MAC interface
 - Time-aware egress scheduler
- DOS attack prevention
 - Support IPv6
- IGMP snooping, MLD snooping support
- Green mode support
- Spanning tree support (multiple spanning trees—up to eight)
- Loop detection for unmanaged configurations with Broadcom's patented LoopDTech™ technology
- CableChecker™ with unmanaged mode support
- Double tagging/QinQ
- IEEE 802.az EEE (Energy Efficient Ethernet) support
- IEEE 802.3as support
- IEEE 802.3x programmable per-port flow control and backpressure, with IEEE 802.1x support for secure user authentication
- EEPROM, MDC/MDIO, and SPI Interfaces
- Serial Flash Interface for accessing embedded 8051 processor
- 4K entry MAC address table with automatic learning and aging
- 192 KB packet buffer
- 256 multicast group support
- Jumbo frame support up to 9720 bytes
- Serial and parallel LED interface
- 1.2V for core and 3.3V for I/O
- JTAG support
- 256 eLQFP

Revision History

<i>Change Description</i>	<i>Customer Impact</i>	<i>Action Items</i>
Revision: 53128-DS07-R Date: 04/06/16		
Updated:		
• “Transmit Output Port Queues” on page 90	Corrected typo for entries number.	No action required.
• Table 291: “EEE GLB Congst TH Register (Page 92h: Address C4h),” on page 293	Corrected typo for entries number.	No action required.
• Table 293: “EEE TXQ Cong TH Register (Page 92h: Address C6h),” on page 293	Corrected typo for entries number.	No action required.
Added:		
• Table 324: “BCM53128IQLE Package – with Heat Sink, 4-layer Board, P=3.1W,” on page 315	–	No action required.
Revision: 53128-DS06-R Date: 06/02/14		
Updated:		
• Table 324: “Ordering Information,” on page 318	Added ordering information for part number BCM53128IQLE(G)	No action required.
Revision: 53128-DS05-R Date: 02/18/13		
Updated:		
• Default bits 13, 12, 8, and 6 in Table 128 on page 197.		
• Default bits 11, 10, 8, 7, 6, and 5 in Table 132 on page 200.		
• Default bits 12, 11, 10, 9, and 8 in Table 137 on page 205.		
• Table 321: “Ordering Information,” on page 319.		
Revision: 53128-DS04-R Date: 07/21/11		
Updated:		
• General Description	Updated the general description.	No action required.

<ul style="list-style-type: none"> Section 12: "Ordering Information," on page 319 	Added ordering information for part number BCM53128VIQLE(G)	No action required.

Revision: 53128-DS03-R

Date: 12/13/10

Updated:

<ul style="list-style-type: none"> "IGMP Snooping" on page 49 	None.	No action required.
<ul style="list-style-type: none"> "Loop Detection" on page 52 	Updated referenced document.	No action required.
<ul style="list-style-type: none"> "Address Resolution and Frame Forwarding" on page 59 	Edited the forward field.	Corrected typo.
<ul style="list-style-type: none"> "Multicast Addresses" on page 61 	Removed reference to IP_MULTICAST bit.	No action required.
<ul style="list-style-type: none"> Table 8: "Multicast Forward Field Definitions," on page 61 	Replaced IP_MULTICAST column with UNICAST/MULTICAST column and updated the forwarding field.	No action required.
<ul style="list-style-type: none"> Table 9: "Address Table Entry for Multicast Address," on page 61 	Replaced IPMCO with FWD_PRT_MAP.	No action required.
<ul style="list-style-type: none"> "Energy Efficient Ethernet Mode" on page 66 	Updated referenced document.	No action required.
<ul style="list-style-type: none"> "Serial Flash Interface" on page 95 	Updated SRAM value.	No action required.
<ul style="list-style-type: none"> Figure 44: "Write Access to the Register Set Using the PseudoPHY (PHYAD = 11110) MDC/MDIO Path," on page 119 	Changed Read MII Register 27 to Write Register 27.	Corrected typo.
<ul style="list-style-type: none"> Table 29: "Signal Type Definitions," on page 126 	Updated XTALO signal description and added GPIO pins.	No action required.
<ul style="list-style-type: none"> Section 6: "Pin Assignment," on page 139 	Updated pin assignments to include GPIO pins.	New feature option available.
<ul style="list-style-type: none"> "BCM53128KQLE Pin List by Ball Name" on page 141 	Updated pin list to include GPIO pins	New feature option available.
<ul style="list-style-type: none"> Table 31: "Control Registers (Page 00h)," on page 145 	Added addresses B0h-B7h and B8h-BFh to table.	No action required.
<ul style="list-style-type: none"> "PHY Identifier Register (Page 10h–17h: Address 04h)" on page 199 	Edited binary OUI.	Corrected typo.
<ul style="list-style-type: none"> Table 170: "Expansion Register 45h: Transmit CRC," on page 233 	Added addresses B8h-BBh and BCh-BFh	No action required.
<ul style="list-style-type: none"> Table 295: "Absolute Maximum Ratings," on page 299 	Updated maximum value for electrostatic discharge (V_{ESD})	Corrected typo.
<ul style="list-style-type: none"> Table 297: "Electrical Characteristics," on page 300 	Updated XTALI minimum and maximum.	No action required.
<ul style="list-style-type: none"> Figure 64: "SPI Timings, SS Asserted During SCK High," on page 313 	Updated figure.	No action required.
<ul style="list-style-type: none"> Table 316: "SPI Timings," on page 313 	Added time interval rows	No action required.

Added:

About This Document

Purpose and Audience

This document is for designers interested in integrating the BCM53128 switches into their hardware designs and for others who need specific data about the physical characteristics and operation of the BCM53128 switches.

Acronyms and Abbreviations

In most cases, acronyms and abbreviations are defined on first use.

For a comprehensive list of acronyms and other terms used in Broadcom documents, go to:

<http://www.broadcom.com/press/glossary.php>.

Document Conventions

The following notational conventions are used in this document:

- Signal names are shown in uppercase letters (such as DATA).
- A bar over a signal name indicates that it is active low (such as $\overline{\text{CE}}$).
- In register and signal descriptions, [n:m] indicates a range from bit n to bit m (such as [7:0] indicates bits 7 through 0, inclusive).
- The use of R or Reserved indicates that a bit or a field is reserved by Broadcom for future use. Typically, R is used for individual bits and Reserved is used for fields.
- Numerical modifiers such as K or M follow traditional usage (for example, 1 KB means 1,024 bytes, 100 Mbps [referring to fast Ethernet speed] means 100,000,000 bps, and 133 MHz means 133,000,000 Hz).

References

The references in this section may be used in conjunction with this document.

Note: Broadcom provides customer access to technical documentation and software through its Customer Support Portal (CSP) and Downloads and Support site (see [Technical Support](#)).

For Broadcom documents, replace the “xx” in the document number with the largest number available in the repository to ensure that you have the most current version of the document.

Technical Support

Broadcom provides customer access to a wide range of information, including technical documentation, schematic diagrams, product bill of materials, PCB layout information, and software updates through its customer support portal (<https://support.broadcom.com>). For a CSP account, contact your Sales or Engineering support representative.

In addition, Broadcom provides other product support through its Downloads and Support site (<http://www.broadcom.com/support/>).

Section 1: Introduction

Overview

The BCM53128 is a single-chip, 9-port Gigabit Ethernet (GbE) switch device. It provides:

- A 9-port nonblocking 10/100/1000-Mbps switch controller
- Eight ports with 10/100/1000BASE-TX-compatible transceivers
- Nine integrated Gigabit MACs (GMACs)
- One GMII/RGMII/MII/RvMII/TMII/RvTMII port for PHY-less connection to the management agent
- An integrated Motorola SPI-compatible interface
- High performance, integrated packet buffer memory
- An address resolution engine
- A set of management information base (MIB) statistics registers

The GMACs support full-duplex and half-duplex modes for 10 Mbps and 100 Mbps and full-duplex for 1000 Mbps. Flow control is supported in the half-duplex mode with backpressure. In full-duplex mode, IEEE 802.3x frame-based flow control is supported. The GMACs are IEEE 802.3-compliant and support maximum frame sizes of 9720 bytes.

An integrated address management engine provides address learning and recognition functions at maximum frame rates. The address table provides capacity for learning up to 4K unicast addresses. Addresses are added to the table after receiving an error-free packet.

The MIB statistics registers collect receive and transmit statistics for each port and provide direct hardware support for the Ether-like MIB, MIB II (interfaces), and the first four groups of the RMON MIB. All nine groups of RMON can be supported by using additional capabilities, such as port mirroring/snooping, together with an external microcontroller to process some MIB attributes. The MIB registers can be accessed through the Serial Peripheral Interface Port by an external microcontroller.

Section 2: Features and Operation

Overview of Features and Operation

The BCM53128 switches include the following features:

- “Quality of Service” on page 34
- “Port-Based VLAN” on page 38
- “IEEE 802.1Q VLAN” on page 39
- “Programming the VLAN Table” on page 40
- “Double-Tagging” on page 41
- “Jumbo Frame Support” on page 44
- “Port Trunking/Aggregation” on page 44
- “WAN Port” on page 45
- “Rate Control” on page 45
- “Protected Ports” on page 47
- “Port Mirroring” on page 48
- “IGMP Snooping” on page 49
- “MLD Snooping” on page 50
- “IEEE 802.1x Port-Based Security” on page 50
- “DoS Attack Prevention” on page 51
- “MSTP Multiple Spanning Tree” on page 52
- “Software Reset” on page 52
- “Loop Detection” on page 52
- “BroadSync HD” on page 53
- “CableChecker™” on page 56
- “Egress PCP Remarking” on page 57
- “Address Management” on page 57
- “Power Savings Modes” on page 65

The following sections discuss each feature in more detail.

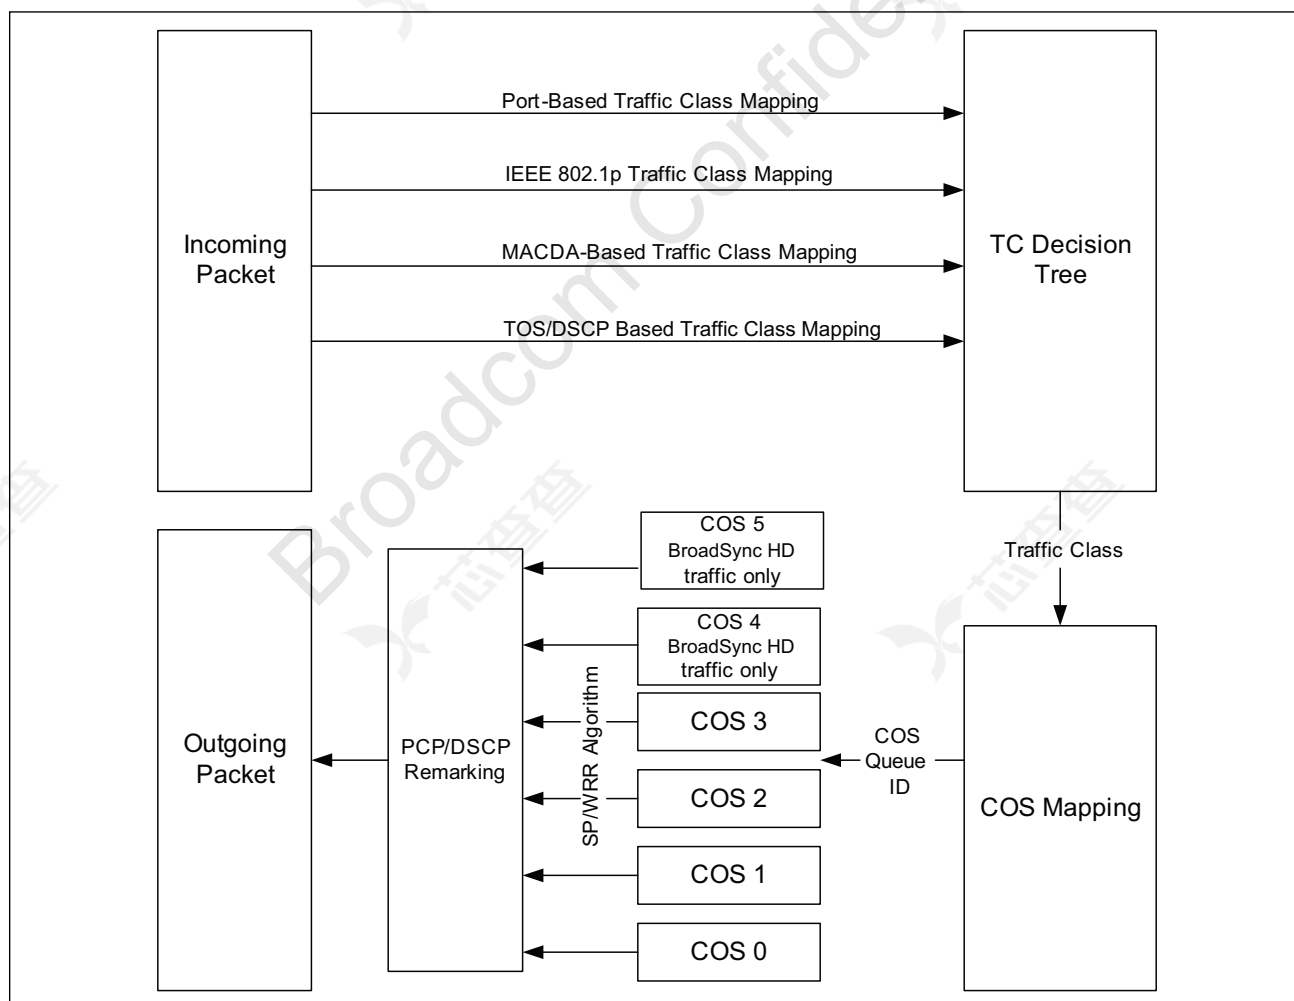

Quality of Service

The Quality of Service (QoS) feature provides up to six internal queues per port to support six different traffic classes (TC). The traffic classes can be programmed so that higher-priority TC in the switch experiences less delay than lower-priority TC under congested conditions. This can be important in minimizing latency for delay-sensitive traffic. The BCM53128 switches can assign the packet to one of the six egress transmit queues according to information in:

- “Port-Based QoS” on page 35 (ingress port ID)
- “IEEE 802.1p QoS” on page 35
- “MACDA-Based QoS” on page 36
- “TOS/DSCP QoS” on page 36

The “TC Decision Tree” on page 36 decides which priority system is used based on three programmable register bits detailed in Table 1: “TC Decision Tree Summary,” on page 36. The corresponding traffic class is then assigned to one of the six queues on a port-by-port basis.

Figure 2: QoS Program Flow

Egress Transmit Queues

Each Ethernet egress port has six transmit queues (COS0–COS5). The COS4 and COS5 are dedicated to BroadSync® HD traffic only and can not be shared with other traffic. Each COS queue has its own dedicated counter to measure the buffer occupancy of the queue for congestion management purpose. Every Ethernet (ingress) port has its own set of counters to measure the buffer occupancy and the arrival rate related to the traffic received from the port.

The IMP (egress) port serves four queues (COS0–COS3) and the traffic generated by the Local Management Packet Generator which generate management report messages back to CPU, e.g., the Time Sync TX time stamp packets.

Each COS queue has its own dedicated counter to measure the buffer occupancy of the queue for congestion management purpose. The IMP (ingress) port also has its own set of counters to measure the buffer occupancy and the arrival rate related to the traffic received from the port, but should be used only if it is configured as a regular Ethernet port.

All incoming frames are assigned to an egress transmit queue depending on their assigned TC. Each egress transmit queue is a list specifying an order for packet transmission. The corresponding egress port transmits packets from each of the queues according to a programmable algorithm, with the higher TC queues being given greater access than the lower TC queues. Queue 0 is the lowest-TC queue.

The COS0–COS3 queues are dedicated to non-BroadSync HD traffic only and as programmed in the TX Queue Control register. The BCM53128 uses strict priority (SP) and weighted round robin (WRR) algorithm for COS0–COS3 queues scheduling. The scheduling is configurable using the TX Queue Control register as one of following combinations of SP and WRR; 4SP, 4WRR, 1SP and 3WRR, 2SP and 2WRR. The WRR algorithm weights for each queue can be programmed using the TX Queue Weight register.

Port-Based QoS

The TC of a packet received from an Ethernet (or IMP) port is assigned with the TC configured for the corresponding port. The mapping mechanism is globally enabled/disabled by programming the QoS Global Control register; the mapping entry is also per-port configured using the Default IEEE 802.1Q Tag register. When disabled, the TC that results from this mapping is 000.

IEEE 802.1p QoS

The TC of a packet received from an Ethernet (or IMP) port is assigned with TC-configured for the corresponding IEEE 802.1p priority code point (PCP). The mapping mechanism is per port enabled/disabled using QoS IEEE 802.1p Enable register, the mapping entries are per-port configured by Port N (N = 0–7, 8) PCP_To_TC register. When disabled or if the incoming packet is not tagged, the TC that results from this mapping is 000.

MACDA-Based QoS

MACDA-Based QoS is enabled when the IEEE 802.1p QoS is disabled using the 802_1P_EN bit in the QoS IEEE 802.1p Enable register. When using MACDA-based QoS, the destination address and VLAN ID is used to index the ARL table as described in “[Address Management](#)” on page 57. The matching ARL entry contains a 3-bit TC field as shown in [Table 7](#) on page 60. These bits set the MACDA-based TC for the frame. The MACDA-based TC is assigned to the TC bits depending upon the result shown in [Table 1](#). The TC for the frame is mapped to one of the egress transmit queues base on the ingress port using the TC_To_COS Mapping register. The TC bits for a learned ARL entry default to 0. To change the default, an ARL entry is written to the ARL table as described in the “[Writing an ARL Entry](#)” on page 63. For more information about the egress transmit queues, see “[Egress Transmit Queues](#)” on page 35.

TOS/DSCP QoS

The TC of a packet received from an Ethernet (or IMP) port is assigned with TC configured for the corresponding IP TOS/DSCP. The mapping mechanism is per port enabled/disabled using QoS DiffServ Enable register, the mapping entries are globally configured by DiffServ Priority Map 0 register through DiffServ Priority Map 3 register. When disabled or the incoming packet is not of IPv4/v6 type, the TC resulted from this mapping is 000.

TC Decision Tree

Non-BroadSync HD Frame

The TC decision tree determines which priority system is assigned to TC-mapping bits for the given frame. As summarized above, the TC bits for the frame can be determined according to the ingress port-based TC, IEEE 802.1p TC, MACDA-based TC, DiffServ TC or MACSA-based TC information. The decision on which TC mapping to use is based on the Port_QoS_En bit and the QoS_Layer_Sel bits of the QoS Global Control register. [Table 1](#) summarizes how these programmable bits affect the derived TC. The DiffServ and IEEE 802.1p QoS TC are only available if the respective QoS is enabled, and the received packet has the appropriate tagging.

Table 1: TC Decision Tree Summary

Port_QoS_En	QoS_Layer_Sel	Value of TC Bits
0	00	IEEE 802.1p TC mapping if available; otherwise, MACDA-based TC mapping.
0	01	DiffServ TC mapping if available; otherwise, TC = 000.
0	10	DiffServ TC mapping for IP frame; otherwise, IEEE 802.1p TC mapping if available; otherwise, MACDA-based TC mapping.
0	11	The highest available TC of the following: IEEE 802.1p TC mapping, DiffServ TC mapping, MACDA-based TC mapping or MACSA-based TC mapping.
1	00	MACSA-based TC mapping if available; otherwise, Port-based TC mapping.
1	01	MACSA-based TC mapping if available; otherwise, Port-based TC mapping.
1	10	MACSA-based TC mapping if available; otherwise, Port-based TC mapping.

Table 1: TC Decision Tree Summary (Cont.)

Port_QoS _En	QoS_Layer _Sel	Value of TC Bits
1	11	The highest available TC of the following: Port-based TC mapping, MACSA-based TC mapping, IEEE 802.1p TC mapping, DiffServ TC mapping or MACDA-based TC mapping.

BroadSync HD Frame

For the BroadSync HD packet from an Ethernet port, the TC is determined directly from the explicit IEEE 802.1Q/P tag carried in the BroadSync HD packets (BroadSync HD packets are expected to always be tagged), which is independent of [Table 1 on page 36](#) TC mapping.

The conditions deciding whether an incoming packet is BroadSync HD are:

1. The port from which the packet is received is configured as BroadSync HD-enabled.
2. The packet received is either VLAN tagged or priority tagged, with PCP = 4 or 5.
3. The MACDA is of multicast type and can be found through ARL table search.

Note: BroadSync HD cannot be received from the IMP port.

Queuing Class (COS) Determination

The BCM53128 supports the COS mapping through the mapping mechanisms listed below.

- TC to COS mapping: The queuing class to forward a packet to an Ethernet port is mapped from the TC determined for the packet. The mapping entries are globally configured using TC_To_COS Mapping register.
- BroadSync HD to COS mapping: The queuing class to forward a BroadSync HD packet to a BroadSync HD-enabled Ethernet port is mapped from the PCP carried by the packet. PCP5 is mapped to COS5 and PCP4 is mapped to COS4.
- CPU to COS mapping: The queuing class to forward a packet to the external CPU through the IMP port is determined based on the reasons to forward (copy or trap) the packet to CPU. The mapping entries are globally configured using CPU_To_COS Map register.

Note: When the BCM53128 is configured in the aggregation mode where the IMP operates as the uplink port to the upstream network processor, the COS is decided from the TC based on the normal packet classification flow. Otherwise, the IMP operates as the interface to the management CPU, and the COS is decided based on the reasons for forwarding the packet to the CPU.

[Table 2](#) shows the reasons for forwarding a packet to the CPU. The ToCPU COS values listed are the default setting and are configurable. In order to prevent out of order delivery of the same packet flow to the CPU, the COS for the mirroring and SA learning reasons must be programmed with a value that is lower than or equal to the value of the other reasons.

Table 2: Reasons to Forward a Packet to the CPU

ToCPU Reason	Description	ToCPU COS
Mirroring	The packet is forwarded (copied) through the IMP port because it needs to be mirrored to the CPU as the capturing device.	0
SA Learning	The packet is forwarded (copied) through the IMP port because its SA needs to be learned by the CPU.	0
Switching /Flooding	The packet is forwarded through the IMP port either because the CPU is one of the intended destination hosts of the packet or because the switch makes the flooding decision to reach all potential destinations.	0
Protocol Termination	The packet is forwarded (trapped) through the IMP port because it implies an IEEE 802.1 defined L2 protocol that needs to be terminated by the CPU.	0
Protocol Snooping	The packet is forwarded (copied) through the IMP port because it implies an L3 or application level protocol that needs to be monitored by the CPU for network security or operation efficiency.	0
Exception Processing	The packet is forwarded (trapped) through the IMP port for some special processing even though the CPU is not the intended destination.	0

A packet could be forwarded to the CPU for more than one reason, therefore the COS selection is based on the highest COS values among all the reasons for the packet.

Port-Based VLAN

The port-based virtual LAN (VLAN) feature partitions the switching ports into virtual private domains designated on a per port basis. Data switching outside of the port's private domain is not allowed. The BCM53128 provide flexible VLAN configuration for each ingress (receiving) port.

The port-based VLAN feature works as a filter, filtering out traffic destined to nonprivate domain ports. The private domain ports are selected for each ingress port using Port-Based VLAN Control register. For each received packet, the ARL resolves the DA and obtains a forwarding vector (list of ports to which the frame will be forwarded). The ARL then applies the VLAN filter to the forwarding vector, effectively masking out the nonprivate domain ports. The frame is only forwarded to those ports that meet the ARL table criteria, as well as the port-based VLAN criteria.

IEEE 802.1Q VLAN

The BCM53128 support IEEE 802.1Q VLAN and up to approximately 4000 VLAN table entries that reside in the internal embedded memory. Once the VLAN table is programmed and maintained by the microcontroller, the BCM53128 autonomously handle all operations of the protocol. These actions include the stripping or adding of the IEEE 802.1Q tag, depending on the requirements of the individual transmitting port. It also performs all the necessary VLAN lookups in addition to MAC L2 lookups.

IEEE 802.1Q VLAN Table Organization

Each VLAN table entry, also referred to as a VLAN ID, an Untag map, and a Forward map.

- The Untag map controls whether the egress packet is tagged or untagged.
- The Forward map defines the membership within a VLAN domain.
- If the Ingress port is an ISP port in double-tag mode, the FWD_MODE indicates whether the packet forwarding should be based on VLAN membership or based on ARL flow.

The Untag map and Forward map include bit-wise representation of all the ports.

Figure 3: VLAN Table Organization

Note: When the IEEE 802.1Q feature is enabled, frames sent using the CPU must be tagged. If the MII port is configured as a management port, then the tag is not stripped even if the untag bit is set.

Programming the VLAN Table

The IEEE 802.1Q VLAN feature can be enabled by writing to the Enable IEEE 802.1Q bit in the Global IEEE 802.1Q register. The default priority and VID can be assigned to each port in the Default IEEE 802.1Q Tag register. These are necessary when tagging a previously untagged frame. The Hashing algorithm uses either [VID, MAC] or [MAC] for the ARL index key, depending on the VLAN Learning Mode bits in the Global IEEE 802.1Q register. If both the VID and MAC address are used, a single MAC address is able to be a member of multiple VLANs simultaneously.

The VLAN table can be written using the following steps:

1. Use the VLAN Table Entry register to define the ports that are part of the VLAN group and the ports that should be untagged.
2. Use the VLAN Table Address Index register to define the VLAN ID of the VLAN group.

Note: VLAN ID 0xFFFF is reserved. However VID = 0xFFFF can be forwarded if the VID_FFF_Fwding bit is set in the Global VLAN Control 5 register.

3. Set bit [1:0] = 00 of the VLAN Table Read/Write/Clear Control register to indicate a write operation.
4. Set bit 7 of the VLAN Table Read/Write/Clear Control register to 1, starting the write operation. This bit returns to 0 when the write is complete.

The VLAN table can be read using the following steps:

1. Use the VLAN Table Address Index register to define from which VLAN group to read the data.
2. Set bit [1:0] = 01 of the VLAN Table Read/Write/Clear Control register to indicate a read operation.
3. Set bit 7 of the VLAN Table Read/Write/Clear Control register to 1 to start the read operation. This bit returns to 0 when the read is complete.
4. Read the VLAN Table Entry register to obtain the VLAN table entry information.

Double-Tagging

The BCM53128 provide the double tagging feature, which is useful for ISP applications. When the ISP aggregates incoming traffic from each individual customer, the extra tag (double tag) can provide an additional layer of tagging to the existing IEEE 802.1Q VLAN. The ISP tag (extra tag) is a way of separating individual customers from other customers. Using the IEEE 802.1Q VLAN tag, the individual customer's traffic can be separated.

When the double-tagging feature is enabled using the Global VLAN Control 4 register and the Enable IEEE 802.1Q (bit7) of the Global IEEE 802.1Q register, users can expect two VLAN tags in a frame: the tag close to MAC_SA is the ISP tag, and the one following is the customer tag as shown in [Figure 4](#).

Figure 4: ISP Tag Diagram

The switch uses the ISP tag for ARL and VLAN table accesses and the customer tag as an IEEE 802.1Q tag. There is a per chip programmable register Double Tagging TPID register for ISP tag (default = 9100'h). All ISP tags will be qualified by this Tag Protocol ID (TPID) value.

When the double-tagging feature is enabled, all switch ports are separated into two groups, ISP ports and customer ports. The BCM53128 performs the normalization process for all ingress frames, whether from the ISP port or customer port. The normalization process is to insert an ISP tag, customer tag, or ISP + customer tag (depending whether the ingress frame is without tags or with one tag) to allow all ingress frames with a double tag. But if the ingress frames are with a double tag (ISP + customer tag), and the ISP tag TPID matches the TPID specified in the Double Tagging TPID register, it does not perform the normalization process. The ISP ports are defined in the ISP Port Selection Portmap register. When the port (s) corresponding bit(s) are set, that port (s) should be connected ISP, and otherwise connected to customers. Each switch device can have multiple ports assigned as ISP ports, and each ISP is uniquely identified using different VLAN forward maps or the port-based VLAN feature.

If the ingress frame is an untagged frame, the IEEE 802.1Q tag which can be configured by the Default IEEE 802.1Q Tag Register (Page 34h: Address 10h) will add to an incoming untagged frame. If the ingress frame is tagged with the 802.1p tag, the default VID which can be configured by the Default IEEE 802.1Q Tag Register (Page 34h: Address 10h) will be tagged the incoming 802.1p frame.

ISP Port

It is possible for ISP port to receive three different types of frames: untagged, ISP-tagged, and ISP+Customer-tagged frames.

When the double-tagging feature is enabled and the received frame is untagged (or the TPID does not match with ISP TPID specified in Double Tagging TPID register, the default ISP tag and customer tag are added, and VLAN ID of ISP tag receives it from the port default VID. The frames are forwarded according to the VLAN table. However, if the Port-Based VLAN Control register is enabled, the egress ports specified in the port-VLAN control register override the VLAN table settings. If the received frame is ISP tagged (TPID matches with the ISP tag VLAN ID specified in the double-tagging TPID register), the default customer tag (8100 + default PVID) is added, the ISP VID is used to access the ARL table, and the ISP tag can be stripped on the way out according to the untagged bit setting in the VLAN table. In addition, ISP port frame can forward to the destination port directly based on forward port map of VLAN table by setting FWD_MODE bit to 1 of VLAN Table Entry register.

The VLAN ID is generated from the ISP tag, and TC is generated from the ingress frame outer tag.

Customer Port

It is also possible for Customer port to receive two different types of frames: untagged and Customer-tagged frames.

When the double-tagging feature is enabled, all the ingress frames perform the normalization process to insert a ISP tag or ISP + Customer tag (depending whether the ingress frame is without tags or with one tag) to allow all ingress frames with a double tag. The VLAN ID of ISP tag receives it from the port default VID.

The VLAN ID is generated from the ISP tag, and the TC is generated from the ingress frame outer tag.

Note: It is illegal to strip out the ISP tag on the ISP egress port by using the untagged bit setting in the VLAN table.

Only the VLAN tagged or untagged packets are expected for the ingress of the customer ports. The customer do not add the ISP tags.

There are two possible traffic scenarios; one from a customer port to an ISP port, and one from an ISP port to a customer port.

Uplink Traffic (from Customer Port to ISP)

Data traffic is traffic received from the customer port without tags or a customer tag, and the frame is destined for an ISP port. The customer ingress port performs a normalization process to allow ingress frames with double tags (ISP + Customer tag), and the ISP tag VID is based on the port default VID tag.

However, if the ingress frame is with an 802.1p tag, the VID of 802.1p tag is changed by the VID of port default VID tag after the customer port normalization process. The TC do not change.

Control traffic frames can be forwarded to the CPU first and then the CPU forwards to the ISP port if the switch management mode is enabled and if the RESV_MCAST_FLOOD bit=0 in the Global VLAN Control 4 register. In this case, the control frame adds an ISP tag by ingress port and forward to the CPU. The CPU can then forward it to the ISP port with or without the ISP tag by using the egress-direct feature.

Downlink Traffic (from ISP to Customer Port)

Data traffic frame received from ISP port may or may not have ISP tag attached. When the received frame does not have an ISP tag and customer tag, the ISP ingress port does a normalization process to insert double tags (ISP + Customer tag), and the ISP tag VID is based on the port default VID tag. All ARL and VID table access should be based on the new tag. The traffic is then forwarded to the customer port through proper VLAN configuration. Usually, the software configures so the customer Egress port continuously removes the ISP tag. However, it is based on how the untagged map is configured.

Moreover, if the ingress frame is with an 802.1p tag, the VID of 802.1p tag is changed by the VID of port default VID tag after the ISP port normalization process. The TC will not change.

The Control traffic is forwarded to the CPU when the switch management mode is enable and if the RESV_MCAST_FLOOD bit=0 in the Global VLAN Control 4 register. The BCM53128 can also support multiple ISP port configurations by enabled the FWD_MODE bit of VLAN Table Entry register. There are also two ways to separate traffic that belongs to two different ISP customers:

1. Each group (ISP, and customer) is assigned to the same VLAN group, so that traffic does not leak to other ISP.
2. Use the Port-based VLAN to separate traffic that belongs to a different ISP.

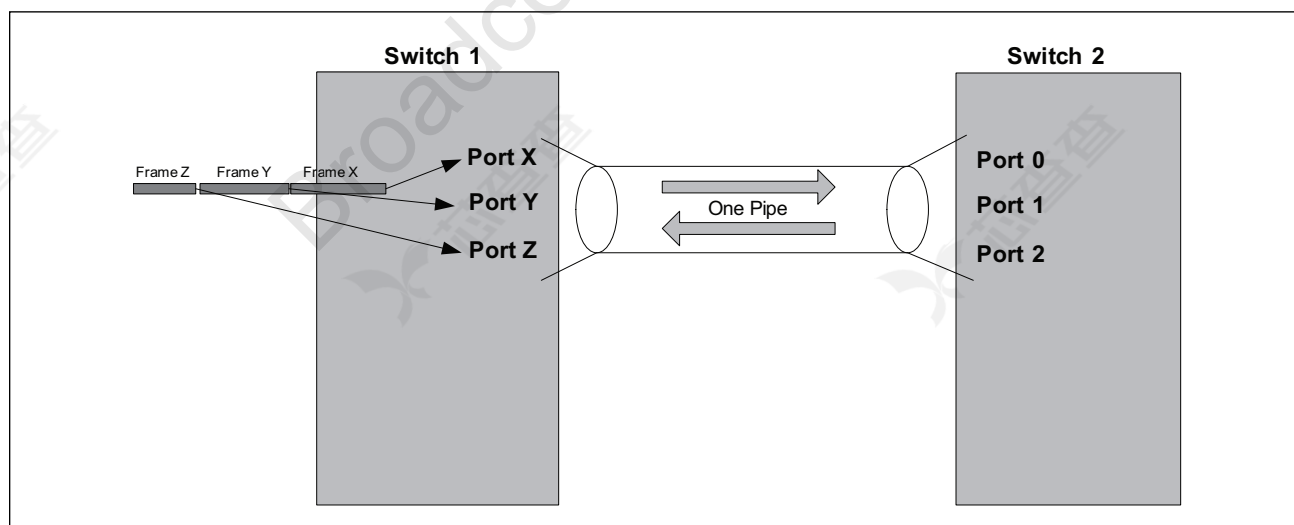

Jumbo Frame Support

The BCM53128 can receive and transmit frames of extended length on ports linked at gigabit speed. Referred to as jumbo frames, these packets are longer than standard maximum size which is defined using the Standard Max Frame Size register, but shorter than 9720 bytes. Jumbo packets can only be received or forwarded to 1000BASE-T linked ports that are jumbo-frame enabled. Up to 38 buffer memory pages are required for storing the longest allowed jumbo frame. While there is no physical limitation to the number of ports that can be jumbo enabled, it is recommended that no more than two be enabled simultaneously to ensure system performance. There is no performance penalty for enabling additional jumbo ports beyond the potential strain on memory resources that can occur due to accumulated jumbo packets at multiple ports.

Port Trunking/Aggregation

The BCM53128 support MAC-based trunking. The trunking feature allows up to four ports to be grouped together as a single-link connection between two switch devices. This increases the effective bandwidth through a link and provides redundancy. The BCM53128 allow up to two trunk groups. Trunks are composed of predetermined ports and can be enabled using Trunking Group 0 register. Ports within a trunk group must be of the same linked speed. By performing a dynamic hashing algorithm on the MAC address, each packet destined for the trunk is forwarded to one of the valid ports within the trunk group. This method has several key advantages. By dynamically performing this function, the traffic patterns can be more balanced across the ports within a trunk. In addition, the MAC-based algorithm provides dynamic failover. If a port within a trunking group fails, the other port within the trunk automatically assumes all traffic designated for the trunk. It allows for a seamless, automatic redundancy scheme. This hashing function can be performed on either the DA, SA, or DA/SA, depending on the Trunk Hash Selector bit of MAC Trunking Control register.

Figure 5: Trunking

WAN Port

The BCM53128 offers a programmable WAN port feature: it has a WAN Port Select register. Select a port as a WAN port, then all of that port's traffic is forwarded to the CPU port only. The non-WAN port traffic from all other local ports does not flood to the WAN port.

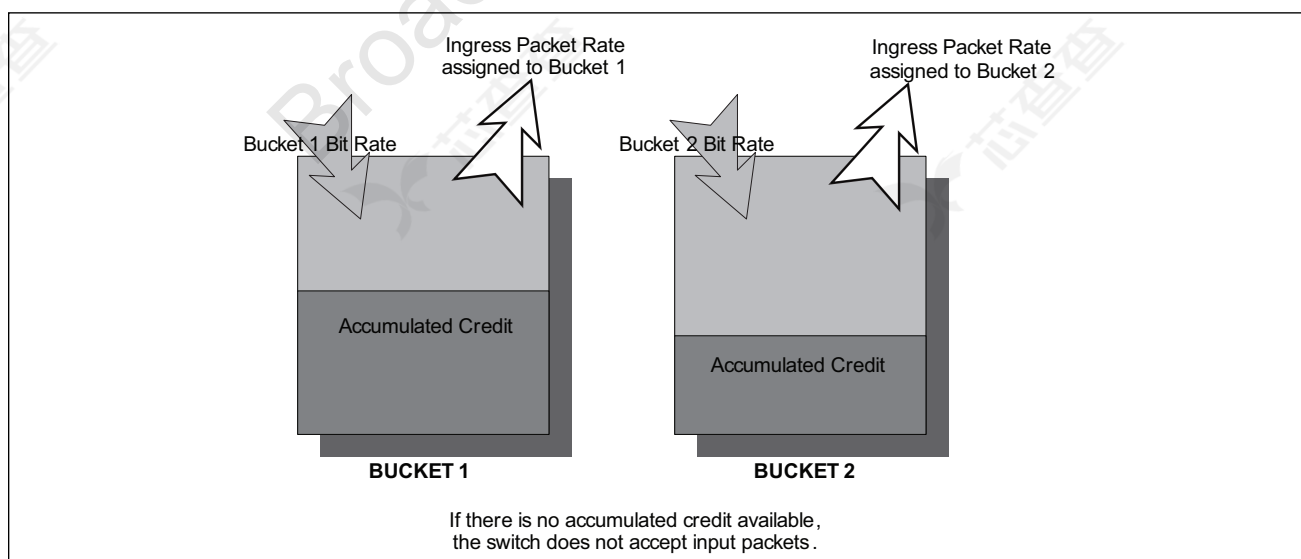

Rate Control

Ingress Rate Control

Forwarding broadcast traffic consumes switch resources, which can negatively impact the forwarding of other traffic. The rate-based broadcast storm suppression mechanism is used to protect regular traffic from an overabundance of broadcast or multicast traffic. This feature monitors the rate of ingress traffic of programmable packet types. If the rates of these packet types exceed the programmable maximum rate, the packets are dropped. To enable the Broadcast Storm Suppression, pull the BC_SUPP_EN high during power-on/reset. Alternatively, the feature can be activated in the Port Receive Rate Control register.

The broadcast storm suppression mechanism works on a credit-based rate system that figuratively uses a bucket to track the bandwidth of each port (see the figure below). Credit is continually added to the bucket at a programmable bucket bit rate. Credit is decremented from the bucket whenever one of the programmable packet types is ingress at the port. If no packets are ingress for a considerable length of time, the bucket credit continues to increase up to a programmable-maximum bucket size. If a heavy burst of traffic is suddenly ingress at the port, the bucket credit becomes drained. When the bucket is emptied, incoming traffic is constrained to the bucket bit rate (the rate at which credit is added to the bucket). At this point, excess packets are either dropped or deterred using flow control, depending upon the Suppression Drop mode in the Ingress Rate Control Configuration register.

Figure 6: Bucket Flow

Two-Bucket System

For added flexibility, the BCM53128 employ two buckets to track the rate of ingress packets. Each of the two buckets (Bucket 0 and Bucket 1) can be programmed to monitor different packet types. For example, Bucket 0 could monitor broadcast packets, while Bucket 1 monitors multicast packets. Multiple packet types can be monitored by each bucket, and a packet type can be monitored by both buckets.

The rates of each bucket can be individually programmed (see “[Bucket Bit Rate](#)”). For example, the broadcast packets of Bucket 0 could have a maximum rate of 3 Mbps, whereas the multicast packets of Bucket 1 could be allowed up to 80 Mbps. The size of each bucket can be programmed using the Suppressed Packet Type Mask of the Ingress Rate Control Configuration register. This determines the maximum credit that can accumulate in each bucket. The Rate Count and Bucket Size can be individually programmed for each port, providing another level of flexibility. Suppression control can be enabled or disabled on a per-port basis Ingress Rate Control Configuration register. This system allows the user to control dual packet-type rates on a per-port basis.

Egress Rate Control

The BCM53128 monitor the rate of egress traffic per port. Unlike the Ingress traffic rate control, the Egress Rate Control provides only the per port rate control regardless of traffic types. This feature only uses one bucket to track the rate of egress packets. The Egress Rate Control feature can be enabled in the Port Egress Rate Control Configuration register and the output rate per port can be controlled by setting the bucket size and Refresh Count in the same register. The Egress Rate Control feature only support absolute bit rate mode (Bit Rate Mode = 0) and the bucket bit rate calculation is shown in [Table 3](#).

Bucket Bit Rate

The relative ingress rates of each bucket can be programmed Port Receive Rate Control register on a per port basis. Each port has a programmable Rate Count value for Bucket 0 and Bucket 1. Additionally, the bit rate mode is programmed Ingress Rate Control Configuration register on a chip basis. If this bit is 1, the packet rate is automatically scaled according to the port link speed. Ports operating at 1000 Mbps would be allotted a 100 times higher ingress rate than ports linked at 10 Mbps. Together, the Rate Count value and the bit rate mode determine the bucket bit rate, which is a reflection of how quickly data can be ingressed (Kbps) at the given port for a given bucket. The Rate Count values are specified in the following table. Values outside these ranges are not valid entries.

Table 3: Bucket Bit Rate

Rate Count (RC)	Bit Rate Mode	Link Speed	Bucket Bit Rate Equation	Approximate Computed Bucket Bit Rate Values (As a function of RC)
1–28	0	Any	$= (RC \times 8 \times 1M) / 125$	64 KB, 128 KB, 192 KB,..., 1.792 MB
29–127	0	Any	$= (RC - 27) \times 1M$	2 MB, 3 MB, 4 MB,..., 100 MB
128–240	0	Any	$= (RC - 115) \times 1M \times 8$	104 MB, 112 MB, 120 MB,..., 1000 MB
1–125	1	10 Mbps	$= (RC \times 8 \times 1M) / 100$	0.08 MB, 0.16 MB, 0.24 MB,... 10 MB
1–125	1	100 Mbps	$= (RC \times 8 \times 1M) / 10$	0.8 MB, 1.6 MB, 2.4 MB,..., 100 MB
1–125	1	200 Mbps	$= (RC \times 8 \times 1M) / 5$	1.6 MB, 3.2 MB, 4.8 MB,..., 200 MB
1–125	1	1000 Mbps	$= RC \times 8 \times 1M$	8 MB, 16 MB, 24 MB,... 1000 MB

Note: 1M represents 1×10^6 .

IMP Port Egress Rate Control

The IMP port egress is configurable of rate limiting at packet-per-second (PPS) granularity, in addition to bits-per-second (BPS) granularity. It can be configured using the IMP Port Egress Rate Control Configuration register.

Protected Ports

The Protected Ports feature allows certain ports to be designated as protected Protected Port Selection register. All other ports are unprotected. Traffic between protected port group members is blocked. However, protected ports are able to send traffic to unprotected ports. Unprotected ports can send traffic to any port. Several applications that can benefit from protected ports:

- **Aggregator:** For example, all the available ports are designated as protected ports except a single aggregator port. No traffic incoming to the protected ports is sent within the protected ports group. Any flooded traffic is forwarded only to the aggregator port.
- To prevent nonsecured ports from monitoring important information on a server port, the server port and nonsecured ports are designated as protected. The nonsecured ports will not be able to receive traffic from the server port.

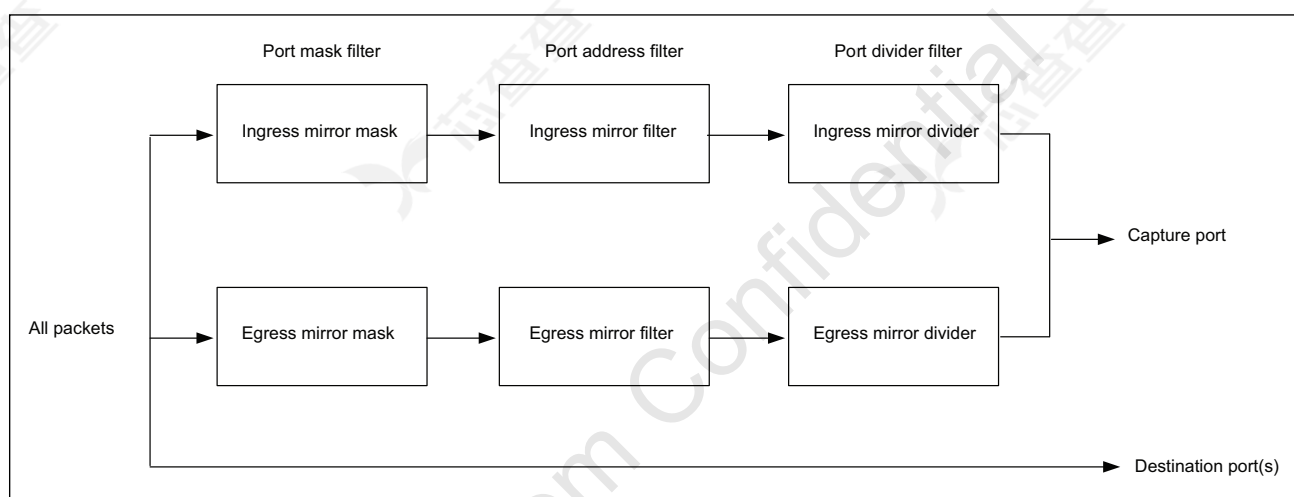

Port Mirroring

The BCM53128 support Port Mirroring, allowing ingress and/or egress traffic to be monitored by a single port designated as the mirror capture port. The BCM53128 can be configured to mirror the ingress traffic and/or egress traffic of any other port (s). Mirroring multiple ports is possible, but can create congestion at the mirror capture port. Several filters are used to decrease congestion.

Enabling Port Mirroring

Port Mirroring is enabled by setting the Mirror Enable bit in the Mirror Capture Control register.

Figure 7: Mirror Filter Flow

Capture Port

The capture port is capable of monitoring other specified ports. Frames transmitted and received at the other ports are forwarded to the Capture port according to the mirror filtering rules discussed below. The Capture port is specified by the Capture Port bits of the Mirror Capture Control register.

Mirror Filtering Rules

Mirror filtering rules consist of a set of three filter operations (Port Mask, Packet Address, and Packet Divider) that are applied to traffic ingressed and/or egressed at a switch port.

Port Mask Filter

The IN_MIRROR_MASK bits in the Ingress Mirror Control register define the receive ports that are monitored. The OUT_MIRROR_MASK bits in the Egress Mirror Control register define the transmit ports that are monitored.

Any number of ingress/egress ports can be programmed to be mirrored, but bandwidth restrictions on the one-mirror capture port should be taken into account to avoid congestion or packet loss.

Packet Address Filter

The Ingress Mirror Control register is used to set the type of filtering that is applied to frames received on the mirrored ports. The IN_MIRROR_FILTER bits select among the following:

- Mirror all received frames
- Mirror received frames with DA = x
- Mirror received frames with SA = x

where x is the 48-bit MAC address programmed into the Ingress Mirror MAC Address register. Likewise, the Egress Mirror Control register is used to set the type of filtering that is applied to frames transmitted on the egressed mirrored ports. The filtering MAC address is specified in the Egress Mirror MAC Address register.

Packet Divider Filter

The IN_DIV_EN bit in the Ingress Mirror Control register allows further statistical sampling. When IN_DIV_EN = 1, the receive frames passing the initial filter are divided by the value IN_MIRROR_DIV, which is a 10-bit value stored in the Ingress Mirror Divider register. Only one out of every n frames is forwarded to the mirror capture port, where $n = \text{IN_MIRROR_DIV} + 1$. This allows the following additional capabilities:

- Mirror every n^{th} received frame
- Mirror every n^{th} received frame with DA = x
- Mirror every n^{th} received frame with SA = x

Similarly, the Egress Mirror Divide function is controlled by the Egress Mirror Control register and the Egress Mirror Divider register.

Note: When multiple ingress ports have been enabled in the IN_MIRROR_MASK, the cumulative total packet count received from all ingress ports is divided by the value of IN_MIRROR_DIV to deliver the n^{th} receive frame to the mirror capture port. Egressed frames are governed by the OUT_MIRROR_MASK bit and the OUT_MIRROR_DIV bit.

IGMP Snooping

The BCM53128 supports IP layer IGMP Snooping which includes IGMP unknown, query, report, and leave messages using the High-Level Protocol Control register.

A frame with a value of 2 in the IP header protocol field and IGMP frames are forwarded to the CPU port. The management CPU can then determine, from the IGMP control packets which port should participate in the multigroup session. The management CPU proactively programs the multicast address in the ARL table or the multiport address entries. If the IGMP_FWD_EN in the High-Level Protocol Control register is enabled, IGMP frames will be trapped to the CPU port only.

MLD Snooping

The BCM53128 supports IP layer MLD Snooping including MLD query, report, and done messages using the High-Level Protocol Control register.

IEEE 802.1x Port-Based Security

IEEE 802.1x is a port-based authentication protocol. By receiving and extracting special frames, the CPU can control whether the ingress and egress ports should forward packets or not. If a user port wants service from another port (authenticator), it must get approved by the authenticator. EAPOL is the protocol used by the authentication process. The BCM53128 detects EAPOL frames by checking the destination address of the frame. The Destination addresses should be either a multicast address as defined in IEEE 802.1x (01-80-C2-00-00-03) or a user-predefined MAC (unicast or multicast) address. Once EAPOL frames are detected, the frames are forwarded to the CPU so it can send the frames to the authenticator server. Eventually, the CPU determines whether the requestor is qualified or not based on its MAC_Source addresses, and frames are either accepted or dropped. The per-port EAP can be programmed in the register.

BCM53128 provides three modes for implementing the IEEE 802.1x feature. Each mode can be selected by setting the appropriate bits in the register.

The Basic Mode (when EAP Mode = 00'b) is the standard mode, the EAP_BLK_MODE bit would be set before authentication to block all of the incoming packets, upon authentication, the EAP_BLK_MODE bit would be cleared to allow all the incoming packets. In this mode, the Source Address of incoming packets is not checked.

The second mode is Extended Mode (when EAP Mode = 10'b), where an extra filtering mechanism is implemented after the port is authenticated. If the Source MAC address is unknown, the incoming packets would be dropped and the unknown SA would not be learned. However if the incoming packet is IEEE 802.1x packet, or special frames, the incoming packets will be forwarded. The definition of the Unknown SA in this case is when the switch cannot match the incoming Source MAC address to any of the addresses in ARL table, or the incoming Source MAC address matches the address in ARL table, but the port number is mismatched. The third mode is Simplified Mode (when EAP Mode = 11'b). In this mode, the unknown Source MAC address packets would be forwarded to CPU rather than dropped. Otherwise, it is same as the Extended Mode operation.

Note: The BCM53128 checks only the destination addresses to qualify EAPOL frames. Ethernet type fields, packet type fields, or non-IEEE 802.1Q frames are not checked.

DoS Attack Prevention

The BCM53128 supports the detection of the following DoS (Denial of Service) attack types based on a register setting, which can be programmed to drop or not to drop each type of DoS packet, respectively.

Table 4: DoS Attacks Detected by BCM53128

DoS Attack Type	Description
IP_LAND	IPDA = IPSA in an IPv4/IPv6 datagram
TCP_BLAT	DPort = SPort in a TCP header carried in an unfragmented IP datagram or in the first fragment of a fragmented IP datagram
UDP_BLAT	DPort = SPort in a UDP header carried in an unfragmented IP datagram or in the first fragment of a fragmented IP datagram
TCP_NULLScan	Seq_Num = 0 and all TCP_FLAGS = 0 in a TCP header carried in an unfragmented IP datagram or in the first fragment of a fragmented IP datagram
TCP_XMASScan	Seq_Num = 0, FIN = 1, URG = 1, and PSH = 1 in a TCP header carried in an unfragmented IP datagram or in the first fragment of a fragmented IP datagram
TCP_SYNFINScan	SYN = 1 and FIN = 1 in a TCP header carried in an unfragmented IP datagram or in the first fragment of a fragmented IP datagram
TCP_SYNErrror	SYN = 1, ACK = 0, and SRC_Port < 1024 in a TCP header carried in an unfragmented IP datagram or in the first fragment of a fragmented IP datagram
TCP_ShortHDR	The length of a TCP header carried in an unfragmented IP datagram or the first fragment of a fragmented IP datagram is less than MIN_TCP_Header_Size
TCP_FragError	The Fragment_Offset = 1 in any fragment of a fragmented IP datagram carrying part of TCP data
ICMPv4_Fragment	The ICMPv4 protocol data unit carried in a fragmented IPv4 datagram
ICMPv6_Fragment	The ICMPv6 protocol data unit carried in a fragmented IPv6 datagram
ICMPv4_LongPing	The ICMPv4 ping (echo request) protocol data unit carried in an unfragmented IPv4 datagram with its Total Length indicating a value greater than the MAX_ICMPv4_Size + size of IPv4 header
ICMPv6_LongPing	The ICMPv6 ping (echo request) protocol data unit carried in an unfragmented IPv6 datagram with its payload length indicating a value greater than the MAX_ICMPv6_Size

- MIN_TCP_Header_Size is programmable between 0 and 255 bytes, inclusive. The default value is set to 20 bytes (TCP header without options).
- MAX_ICMPv4_Size is programmable between 0 and 9.6 KB, inclusive. The default value is set to 512 bytes.
- MIN_TCP_Header_Size is programmable between 0 and 9.6 KB, inclusive. The default value is set to 512 bytes.
- The default control setting for all types of DoS attacks is not to drop the DoS attack packet.
- It is globally configurable whether to perform the SA learning operation with the received packets of the DoS attack type defined in the registers, regardless of the individual DoS attack types.
- Once a packet is detected as a DoS attack type that must be dropped, the packet is dropped regardless of ARL forwarding decisions, but its forwarding based on mirroring function is not affected.

MSTP Multiple Spanning Tree

The BCM53128 supports up to eight multiple spanning trees. When the EN_RX_BPDU bit = 1, the BCM53128 forwards BPDU packets to the management port only.

Software Reset

The BCM53128 provide Software Resets. Software Resets can be triggered by programming the Software Reset Control register.

Loop Detection

The BCM53128 provide the Loop Detection feature for unmanaged environments (that is, those without a management CPU). When the Loop Detection feature is enabled and activated, the switch generates Broadcom proprietary tag frames (Loop Discovery Frames) at a programmed interval, and when it detects a loop, it gives a loop detected warning with a blinking LED or with a sound produced by a speaker. This feature does not repair the loop, but only issues a warning.

The Discovery Frame is a broadcast frame, and the switch ensures the forwarding of the frame by providing special priority for the frame by giving it a higher priority over other broadcast frames, assigning highest queue automatically and overwriting the pause condition. The control/options over this feature are provided beginning with the Loop Detection Control register.

The Loop Discovery frame uses a default multicast address (01-80-C2-00-00-01) in the Loop Detect Source Address register as a source address. Using a multicast address as a source address is illegal in the IEEE standard; however, since this is only intended to be used in the ROBO environment only, it should be allowed. This address scheme is used to avoid a possible disruption in forwarding decision by using a regular random Source Address.

The Loop Discovery frame also uses the Module ID 0 register along with the Module ID 1 register to identify the origin of the Discovery frame. These registers are used to define a Source Chip ID and Source Port ID to distinguish the Discovery Frames from other ROBO chips.

The implementation example for the Loop Detect feature is described in the *Layout and Design Guide* (document number 53128-AN1xx-R).

BroadSync HD

BroadSync HD is the enhancement to IEEE 802.3 MAC and IEEE 802.1D bridges to support the kind of low-latency isochronous services and guaranteed quality of service (QoS) that is required for many consumer electronics applications.

The BCM53128 provides the BroadSync HD feature through the BroadSync HD Enable Control register. The BCM53128 always forwards BPDU, MRP packets to CPU for BroadSync HD applications, and handles the IEEE 802.1 Time Sync Protocol.

The BCM53128 can identify a packet as a BroadSync HD packet if the MAC DA matches a MAC address in the ARL table. The PCP equals four or five and the ingress port is BroadSync HD-enabled. There are two dedicated queues for BroadSync HD Class 5 and Class 4 traffic per egress port. BCM53128 enhances shaping and scheduling for BroadSync HD operation.

Time Base and Slot Generation

For BroadSync HD applications, the BCM53128 maintains a time base (32-bit counter) running at a granularity of 1 ns, which can be adjusted by CPU for synchronization with the BroadSync HD time master unit (Switch or Host) through the IEEE 802.1 Time Synchronized (TS) protocol (to be standardized). The TS protocol is implemented by the CPU which requires the BCM53128 to perform the following operations.

- A received TS protocol packet is time stamped at the ingress port when the first byte (of MACDA) arrives, and is transferred along with the receiving time stamp to the CPU.
- A TS protocol packet initiated by the CPU (to be transmitted at an egress port) is time stamped at the egress port when the first byte (of MACDA) is transmitted, and the transmit time stamp recorded at the egress port is reported back to CPU.

It is required that the time synchronization point peers over an Ethernet link is chosen such that the link delay is perceived as constant, and the protocol exchange occurs at least every 10 ms over every link.

The CPU may be required to speed up or slow down the time base maintained in BCM53128 based on the TS protocol execution. The BCM53128 provides the time base adjustment mechanism for graceful time changes based on CPU instructions.

In addition, the BCM53128 maintains counter mechanism to generate time Slot for BroadSync HD traffic scheduling.

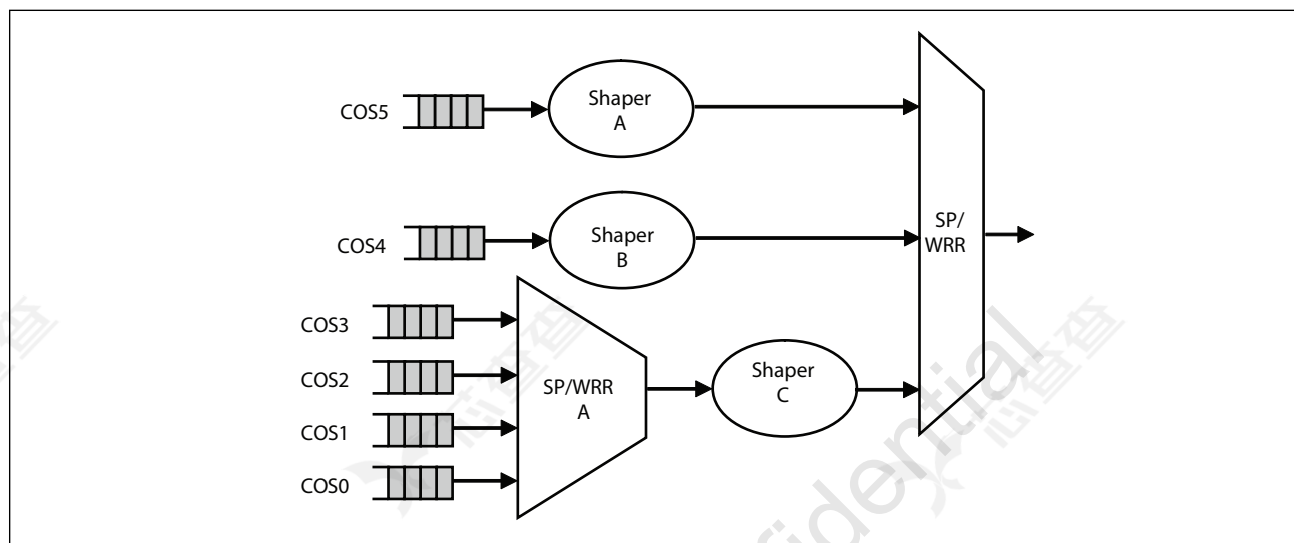

- A Slot is defined as 125 μ s, it is used to pace the BroadSync HD Class 5 traffic which has tight jitter requirements;
- A MacroSlot is configurable as 1 ms, 2 ms, or 4 ms (binary number of Slots) using the BroadSync HD Slot Adjustment register. It is used to pace the BroadSync HD Class 4 traffic which has relaxed jitter requirements.

The CPU may be required to make the Slot wider or narrower based on the TS protocol execution. The BCM53128 provides the Slot adjustment mechanism for graceful Slot width changes based on CPU instructions.

Transmission Shaping and Scheduling

Packets queued at each Ethernet (egress) port is subject to the scheduling behavior as shown in [Figure 8](#).

Figure 8: BroadSync HD Shaping and Scheduling

BroadSync HD Class 5 Media Traffic

The COS5 queue is dedicated for BroadSync HD Class 5 traffic only, and a COS5 packet is always the highest priority to be scheduled for transmission, if it is allowed by the Shaper A that operates as follows.

- The Shaper A is an emulation of fixed bandwidth pipe for Class 5 BroadSync HD traffic with tight jitter adaptively to handle interference from non-BroadSync HD or Class 4 BroadSync HD traffic. Note that the preamble and IPG transmission are not taken into account for the pipe operation.
- Tunable parameters for the Shaper A are listed as follows:
 - MaxAVPacketSize indicates the maximum packet size allowed on a BroadSync HD-enabled port. It is a global setting using the BroadSync HD Max Packet Size register.
 - Class5_BW indicates the reserved bandwidth for Class 5 BroadSync HD traffic at granularity of Byte (per Slot, 125 μ s). It is a per-port setting using BroadSync HD Class 5 Bandwidth Control register.
 - Class5_Window indicates the jitter control for Class 5 BroadSync HD transmission. It is a per-port setting using BroadSync HD Class 5 Bandwidth Control register.
- At the start of each Slot,
 - Reset the credit in the shaping bucket to Class5_BW, if the queue is empty.
 - Reset the credit in the shaping bucket to Class5_BW, if the queue is not empty and Class5_Window is set to 0.
 - Reset the credit in the shaping bucket to Class5_BW, if the queue is not empty, Class5_Window is set to 1, and the credit remained in the shaping bucket is greater than MaxAVPacketSize.
 - Add Class5_BW to the credit in the shaping bucket, if the queue is not empty, Class5_Window is set to 1, and the credit remained in the shaping bucket is less than or equal to MaxAVPacketSize.

- The credit in the shaping bucket decrements for every byte transmitted for the Class 5 BroadSync HD traffic through the port.
 - If the credit reaches 0 before the end of the current Slot while transmitting a Class 5 BroadSync HD packet, the ongoing packet transmission is not interrupted, and the credit stays at 0 until being reset at the start of next Slot.
 - The credit decrements resumes at the next Slot if the ongoing transmission continues.

As long as the credits in the shaping bucket is greater than 0, a Class 5 BroadSync HD packet is allowed to be scheduled for transmission.

BroadSync HD Class 4 Media Traffic

The COS4 queue is dedicated for BroadSync HD Class 4 traffic only, and a COS4 packet always yield to COS5 traffic (if allowed to be scheduled), but takes precedence over the traffic from COS0~COS3 queues or follow the weight ratio between COS4 and COS0~COS3 for transmission scheduling, if it is allowed by the Shaper B that operates as follows.

- The Shaper B is an emulation of fixed bandwidth pipe for Class 4 BroadSync HD traffic with relaxed jitter adaptively to handle interference from non-BroadSync HD or Class 5 BroadSync HD traffic. It also statistically levels the Class 4 BroadSync HD transmission bursts towards the next hop switch to reduce the buffering requirements, by using Slot (instead of MacroSlot) as the pacing mechanism. The preamble and IPG transmission are not accounted for in the pipe operation.
- Tunable parameters for the Shaper B are listed as follows:
 - MacroSlot_Period indicates the periodic cycle time to shape the Class 4 traffic. It is a global setting using BroadSync HD Slot Adjustment register to indicate 1 ms, 2 ms, or 4 ms.
 - MaxAVPacketSize indicates the maximum packet size allowed on a BroadSync HD-enabled port. It is a global setting. (same as for BroadSync HD Class 5 setting)
 - Class4_BW indicates the evenly divided bandwidth share per Slot, which is derived from dividing the reserved bandwidth for Class 4 BroadSync HD traffic at granularity of Byte (per MacroSlot) by the number of Slots within a MacroSlot. It is a per-port setting using BroadSync HD Class 4 Bandwidth Control register.
- At the start of each Slot,
 - If the Slot is the first one for the current MacroSlot, reset the credit bucket to Class4_BW+MaxAVPacketSize; (MaxAVPacketSize is used as the deficit base)
 - Otherwise, add Class4_BW to the credit in the shaping bucket.
- The shaping credit bucket decrements for every byte transmitted for the Class 4 BroadSync HD traffic.

As long as the credits in the shaping bucket is greater than or equal to MaxAVPacketSize, a Class 4 BroadSync HD packet is allowed to be scheduled for transmission.

CableChecker™

The BCM53128 provide the cable diagnostic capabilities for unmanaged environments. The actual cable diagnostic feature lies in the PHY functional block. The BCM53128 devices let the user monitor the cable diagnostic results through LED display by setting the appropriate bits in the LED refresh registers.

The BCM53128 uses the existing LED display (which is already assigned to various functions) to indicate the cable diagnostic results. The table below shows the cable diagnostic result output for each LED function where 1 and 0 represent the LED indication pin status; 1 indicates active and 0 indicates nonactive.

Note:

- The best way for a user to visualize the cable diagnostic test result through LEDs is to bring out the LINK status bit to the LED display along with other functions to be displayed per port. In this way, the user can observe the cable diagnostic result from the flashing (or lit) LED of other functions while LINK LED is off. The switch will turn off the LINK status LED during the cable diagnostic mode.
- The cable diagnostic is expected to be most effective when the user cannot establish the link with the partner.

Table 5: Cable Diagnostic Output

LED Function in LED Function Register	Cable Diagnostic Output
Reserved	—
LNK	No output during the cable diagnostic mode
DPX	1: Passed 0: Failed
ACT	1: Passed 0: Failed
COL	1: Passed 0: Failed
LNK/ACT	No output during the cable diagnostic mode
DPX/COL	1: Passed 0: Failed
SPD10M	1: Failed 0: Passed
SPD100M	In LED function0 map 1: Cable diagnostic passed 0: Failed In LED function1 map 1: Cable diagnostic failed 0: Passed

Egress PCP Remarking

The BCM53128 provides an egress PCP remarking feature of the outer tag at each egress port which includes the PCP field modification based on the internal generated TC. The Egress PCP remarking process applies to Ethernet ports only and can be enabled by Traffic Remarking Control register. Each Ethernet port can provide a 8-entry mapping table indexed by TC to map to the {New PCP} field for the outgoing packet using Egress Non-BroadSync HD Packet TC to PCP Mapping register.

Note: For the BroadSync HD-enabled egress port, the egress PCP for the non-BroadSync HD class of traffic must never be programmed with values of 100 and 101.

Address Management

The BCM53128 Address Resolution Logic contains the following features:

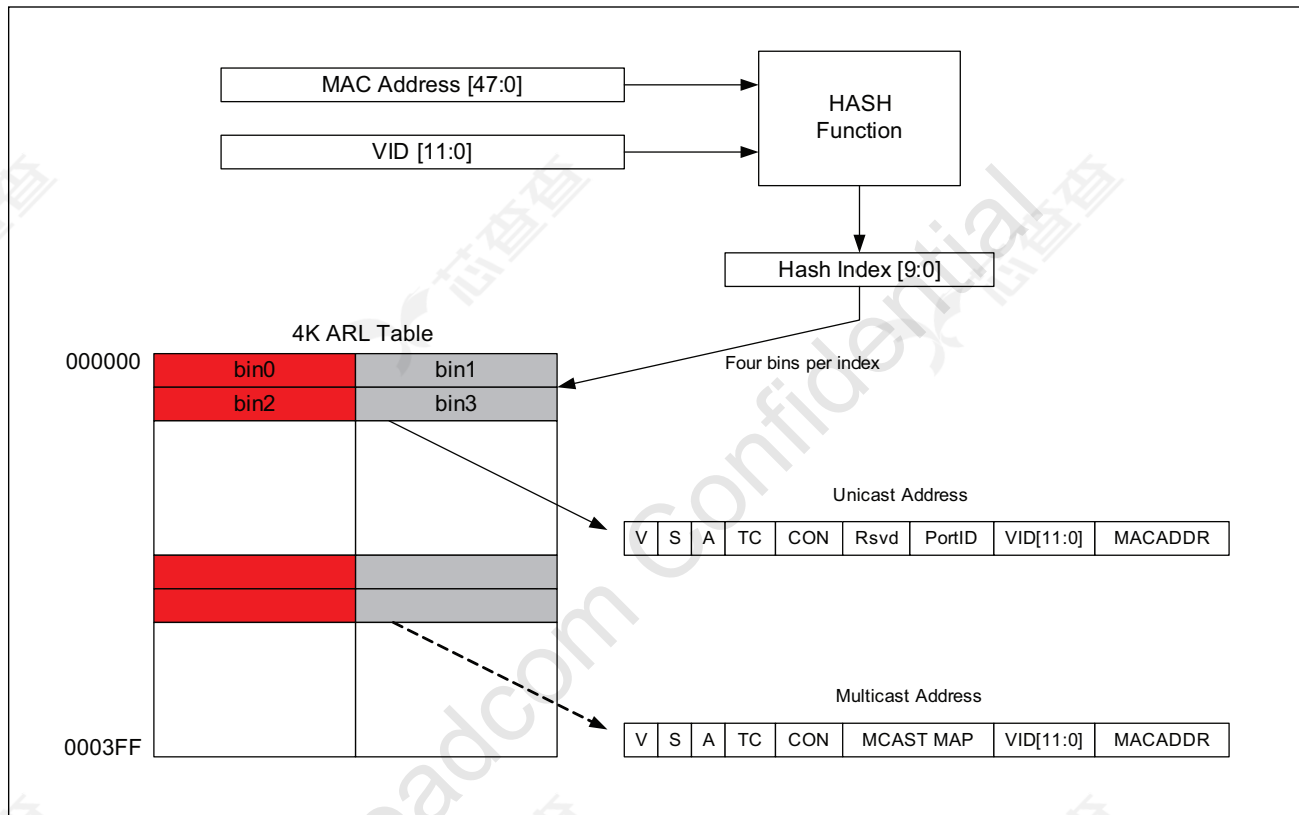

- Four bins per bucket address table configuration.
- Hashing of the MAC/VID address to generate the address table point.

The address management unit of the BCM53128 provides wire speed learning and recognition functions. The address table supports 4K unicast/multicast addresses using on-chip memory.

Address Table Organization

The MAC addresses are stored in embedded SRAM. Each bucket contains four entries or bins. The address table has 1K buckets with four entries in each bucket. This allows up to four different MAC addresses with the same hashed index bits to be simultaneously mapped into the address table. In the ARL DA/SA lookup process, it hashes a 10-bit search index and read out bin0 and bin1 in the first cycle, and read out bin2 and bin3 in the second cycle. These four entries are used for ARL routing and learning.

Figure 9: Address Table Organization

The index to the address table is computed using a hash algorithm based on the MAC address and the VLAN ID (VID) if enabled.

Note: In the Enable IEEE 802.1Q and VLAN Learning Mode both the MAC address and the VLAN ID (VID) are used to compute the hashed index. See [“IEEE 802.1Q VLAN” on page 39](#) for more information.

The hash algorithm uses the CRC-CCITT polynomial. The input to the hash is reduced to a 16-bit CRC hash value. Bits[9:0] of the hash are used as an index to the approximately 4K locations of the address table.

The CRC-CCITT polynomial is:

$$x^{16} + x^{12} + x^5 + 1$$

Address Learning

Information is gathered from received unicast packets and learned or stored for the future purpose of forwarding frames addressed to the receiving port. During the receive process, the frame information (such as the Source Address [SA] and VID) is saved until completion of the packet. An entry is created in the ARL table memory if the following conditions are met:

- The packet has been received without error.
- The packet is of legal length.
- The packet has a unicast SA.
- If using IEEE 802.1Q VLAN, the packet is from an SA that belongs to the indicated VLAN domain.
- The packet does not have a reserved multicast destination address. The Multicast Learning bit of the Reserved Multicast Control register can disable this condition.
- There is free space available in memory to which the hashed index points.

When unicast packets are dynamically learned, the VALID bit is set, the AGE bit is set, and the STATIC bit is cleared in the entry. See [Table 7 on page 60](#) for a description of a unicast ARL entry.

Multicast addresses are not learned into the ARL table, but must be written using one of the [“Programming Interfaces” on page 95](#). See [“Writing an ARL Entry” on page 63](#) and [Table 9 on page 61](#) for more information.

Address Resolution and Frame Forwarding

Received packets are forwarded based on the information learned or written into the ARL table. Address resolution is the process of locating this information and assigning a forwarding destination to the packet. The destination address (DA) and VID of the received packet are used to calculate a hashed index to the ARL table. The hashed index key is used by the address resolution function to locate a matching ARL entry. The frame is assigned a destination based on the forward field (PORTID or FWD_PRT_MAP) of the ARL entry. If the address resolution function fails to return a matching ARL entry, the packet is flooded to all appropriate ports. The following two sections describe the specifics of address resolution and frame forwarding for [“Unicast Addresses” on page 59](#) and [“Multicast Addresses” on page 61](#).

Unicast Addresses

Frames containing a unicast destination address are assigned a forwarding field corresponding to a single port. Listed below is the unicast address-resolution algorithm:

- If the multiport addressing feature is enabled and the DA matches one of the programmed multiport addresses, then it is forwarded accordingly. See [“Using the Multiport Addresses” on page 65](#).
- The lower 10 bits of the hashed index key are used as a pointer into the address table memory, and the entry is retrieved.
- If the valid indicator is set and the address stored at one of the locations matches the index key of the packet received, the forwarding field port ID is assigned to the destination port of the packet.
 - If the destination port matches the source port, the packet is not forwarded.
- If the address resolution function fails to return a matching valid ARL entry and the unicast DLF forward bit is set, the frame is forwarded according to the port map in the Unicast Lookup Failed Forward Map register.
- Otherwise, the packet is flooded to all appropriate ports.

See [Table 6](#) for definitions of the unicast index key and the assigned forwarding field. The forwarding field for a unicast packet is the port ID contained in the matching ARL entry. See [Table 7](#) for a description of a unicast ARL entry.

Table 6: Unicast Forward Field Definitions

EN_1QVLAN	Index Key	Forwarding Field
1	DA and VID	Port ID
0	DA	Port ID

Table 7: Address Table Entry for Unicast Address

Field	Description
VID	VLAN ID associated with the MAC address.
VALID	1 = Entry is valid. 0 = Entry is empty.
STATIC	1 = Entry is static—Should not be aged out and is written and updated by software. 0 = Entry is dynamically learned and aged.
AGE	1 = Entry has been accessed or learned since last aging process. 0 = Entry has not been accessed since last aging process.
TC	MACDA-based TC (only valid for static entries). See “Quality of Service” on page 34 for more information.
Reserved	—
Reserved	Only 00 is valid.
PORTID	Port identifier. The port associated with the MAC address.
MAC ADDRESS	48-bit MAC address.

Note: The fields described in [Table 7](#) can be written using the ARL Table MAC/VID Entry N (N=0-3) register and the ARL Table Data Entry N (N = 0–3) register.

Multicast ARL table entries are described in [Table 9 on page 61](#).

Multicast Addresses

Frames containing a multicast destination address are assigned a forwarding field corresponding to multiple ports specified in a port map. Multicast frames are assigned a forwarding field corresponding to a multicast port map from the matching ARL entry (see [“Address Management” on page 57](#)). If no matching ARL entry is found, the packet is flooded to all appropriate ports. Listed below is the multicast address resolution algorithm:

- If the DA matches one of the globally assigned reserved addresses between 01-80-C2-00-00-00 and 01-80-C2-00-00-2F, the packet is handled as described in [Table 10 on page 62](#).
- If the multiport addressing feature is enabled and the DA matches one of the programmed Multiport Addresses, then it is forwarded accordingly. See [“Using the Multiport Addresses” on page 65](#).
- Otherwise, the lower 10 bits of the hashed index key are used as a pointer into the ARL table memory, and the entry is retrieved.
- If the valid indicator is set, and the address stored at the entry locations matches the index key of the packet received, the forwarding field port map is assigned to the destination port of the packet.
- If the address resolution function fails to return a matching valid ARL entry and the multicast DLF forward bit is set (see [“Address Management” on page 57](#)), the frame is forwarded according to the port map in the Multicast Lookup Failed Forward Map register.
- Otherwise, all other multicast and broadcast packets are flooded to all appropriate ports.

See [Table 8](#) for definitions of the multicast index key and the assigned forwarding field. The forwarding field for a multicast packet is the port map contained in the matching ARL entry. See [Table 9](#) for a description of a multicast ARL entry. See [“Accessing the ARL Table Entries” on page 63](#) for more information.

Table 8: Multicast Forward Field Definitions

EN_1QVLAN	Unicast/Multicast	Index Key	Forwarding Field
1	Unicast	DA and VID	Port ID
0	Unicast	DA	Port ID
1	Multicast	DA and VID	FWD_PRT_MAP
0	Multicast	DA	FWD_PRT_MAP

Table 9: Address Table Entry for Multicast Address

Field	Description
VID	VLAN ID associated with the MAC address.
VALID	1 = Entry is valid. 0 = Entry is empty.
STATIC	1 = Entry is static—This entry is not aged out and is written and updated by software. 0 = Not defined.
AGE	The AGE bit is ignored for static ARL table entries.
TC	MACDA-based TC (only valid for static entries). See “Quality of Service” on page 34 for more information.
Reserved	—

Table 9: Address Table Entry for Multicast Address (Cont.)

Field	Description
FWD_PRT_MAP [8:0]	Multicast forwarding mask. 1 = Forwarding enable. 0 = Forwarding disable.
MAC ADDRESS	48-bit MAC address.

Note: The fields described in [Table 9 on page 61](#) can be written using the ARL Table MAC/VID Entry N (N = 0-3) register and the ARL Table Data Entry N (N = 0-3) register.

Unicast ARL table entries are described in [Table 7 on page 60](#).

Reserved Multicast Addresses

[Table 10](#) summarizes the actions taken for specific reserved multicast addresses. Packets identified with these destination addresses are handled uniquely since they are designed for special functions. Bits[4:0] of the Reserved Multicast Control register program groups of these addresses to be dropped or forwarded. Writing to these bits can change the default action of Unmanaged mode summarized in the following table.

Table 10: Behavior for Reserved Multicast Addresses

MAC Address	Function	IEEE 802.1 Specified Action	Unmanaged Mode Action	Managed Mode Action
01-80-C2-00-00-00	Bridge group address	Drop frame	Flood frame	Forward frame to IMP only
01-80-C2-00-00-01	IEEE 802.3x MAC control frame	Drop frame	Receive MAC determines if it is a valid pause frame and then acts accordingly	Receive MAC determines if valid pause frame and acts accordingly.
01-80-C2-00-00-02	Reserved	Drop frame	Drop frame	Forward to frame management port only
01-80-C2-00-00-03	IEEE 802.1x port-based network access control	Drop frame	Drop frame	Forward frame to management port only
01-80-C2-00-00-04–01-80-C2-00-00-0F	Reserved	Drop frame	Drop frame	Forward frame to management port only
01-80-C2-00-00-10	All LANs bridge management group address	Forward frame	Flood frame	Forward frame to all ports including management port
01-80-C2-00-00-11–01-80-C2-00-00-1F	Reserved	Forward frame	Flood frame	Forward frame to all ports excluding management port
01-80-C2-00-00-20	GMRP address	Forward frame	Flood frame	Forward frame to all ports excluding management port

Table 10: Behavior for Reserved Multicast Addresses (Cont.)

MAC Address	Function	IEEE 802.1 Specified Action	Unmanaged Mode Action	Managed Mode Action
01-80-C2-00-00-21	GVRP address	Forward frame	Flood frame	Forward frame to all ports excluding management port
01-80-C2-00-00-22– 01-80-C2-00-00-2F	Reserved	Forward frame	Flood frame ^a	Forward frame to all ports excluding management port

a. Frames flood to all ports. Certain exclusions apply, such as VLAN restrictions.

Static Address Entries

The BCM53128 supports static ARL table entries that are created and updated using one of the [“Programming Interfaces” on page 95](#). These entries can contain either unicast or multicast destinations. The entries are created by writing the entry location using the Page 05h: ARL/VTBL Access registers and setting the STATIC bit. The AGE bit is ignored. Static entries do not automatically learn MAC addresses or port associations and are not aged out by the automatic internal aging process. See [“Writing an ARL Entry” on page 63](#) for details.

Accessing the ARL Table Entries

ARL table entries are accessed by one of two mechanisms. The first mechanism uses the ARL read/write control, which allows an address-entry location to be read, modified, or written based on the value of a known MAC address. The second mechanism searches the ARL table sequentially, returning all valid entries.

Reading an ARL Entry

To read an ARL entry:

1. Set the MAC address in the MAC Address Index register.
2. Set the VLAN ID in the VLAN ID Index register. This is necessary only if the VID is used in the index key.
3. Set the ARL_R/W bit to 1 in the ARL Table Read/Write Control register.
4. Set the START/DONE bit to 1 in the ARL Table Read/Write Control register. This initiates the read operation.

The MAC address and VID are used to calculate the hashed index to the ARL table. The matching ARL entry is read. The contents of entry are stored in the ARL Table MAC/VID Entry N (N = 0–3) register and the ARL Table Data Entry N (N = 0–3) register.

Entries that do not have the VALID bit set should be ignored. The contents of the MAC/VID registers must be compared against the known MAC address and VID. Entries that do not match may be a valid entry, but are not a valid match for the index key. All other read entries are considered valid ARL entries.

Writing an ARL Entry

To write an ARL entry:

1. Follow the steps in [“Reading an ARL Entry” on page 63](#) to read the ARL entry matching the MAC address and VID that are written to the table.
2. Keep the values that remain from the previous read operation.
 - MAC Address Index register
 - VLAN ID Index register
 - ARL Table MAC/VID Entry N (N = 0-3) register
 - ARL Table Data Entry N (N = 0-3) register
3. Modify the correct entry as necessary. Set the STATIC bit so that the entry is not aged out.
4. Set the ARL_R/W bit to 0 in the ARL Table Read/Write Control register.
5. Set the START/DONE bit to 1 in the ARL Table Read/Write Control register. This initiates the write operation.

The MAC address and VID are used to calculate the hashed index to the ARL table.

Searching the ARL Table

The second method to access the ARL table is through the ARL search control. The entire ARL table is searched sequentially, revealing each valid ARL entry. Setting the Start/Done bit in the ARL Table Search Control register begins the search from the top of the ARL table. This bit is cleared when the search is complete. During the ARL search, the Search Valid bit indicates when a found valid entry is available in the ARL Table Search MAC/VID Result N (N = 0-1) register and the ARL Table Search Data Result N (N = 0-1) register. When the host reads the contents of the ARL Table Search Data Result 1 register which located in Page 05h: Address 78h, the search process automatically continues to seek the next valid entry in the address table. Invalid address entries are skipped, providing the host with an efficient way of searching the entire address table.

The ARL search and ARL read/write operations execute in parallel with other register accesses. This allows the host processor to start a read, write, or search process and then read/write other registers, returning periodically to see if the operation has completed.

Address Aging

The aging process periodically removes dynamically learned addresses from the ARL table. When an ARL entry is learned or referenced, the AGE bit is set to 1. The aging process scans the ARL table at regular intervals, aging out entries not accessed during the previous one to two aging intervals. The aging interval is programmable using the Aging Enable and AGE TIME bit in the Aging Time Control register.

Entries that are written and updated using one of the [“Programming Interfaces” on page 95](#), should have the STATIC bit set. Thus, they are not affected by the aging process.

For each entry in the ARL table, the aging process performs the following:

- If the VALID bit is not set, no further action is required.
- If the VALID bit is set and the STATIC is set, no further action is required.
- If the VALID bit is set, the STATIC bit is not set, and the AGE bit is set, then clear the AGE bit. This keeps the entry in the table, but marks it so that it is removed if it is not accessed before the subsequent aging scan.

- If the VALID bit is set, the STATIC bit is not set, and the AGE bit is reset, then reset the VALID bit. This effectively deletes the entry from the ARL table. The entry has been aged out.

Fast Aging

The fast aging function can be enabled per port or VLAN ID:

The port fast aging can be enabled by setting the Start/Done of the Fast-Aging Control register, the Fast Age All Ports bit of the Fast-Aging Port Control register, and the appropriate port bits in the Fast-Aging Port Control register.

The VLAN ID fast aging can be enabled by setting the Start/Done of the Fast-Aging Control register, the Fast Age All VID bit of the Fast-Aging VID Control register, and the appropriate VLAN ID bits of the Fast-Aging VID Control register.

Using the Multiport Addresses

The Multiport Address N (N = 0–5) register can be used to forward a given MAC address and Ether Type to multiple ports. Packets with a corresponding DA are forwarded to the port map contained in the Multiport Vector N (N = 0–5) register. These registers must be controlled using Multiport Control register.

Note: The Multiport Address N (N = 0–5) register is the only mechanism for TS Protocol qualification for the BroadSync HD application. It can be enabled by Multiport Control register.

Power Savings Modes

The BCM53128 offers different power savings modes for different operating states. All the power saving scheme are implemented without any external CPU requirement. The various power savings modes are:

- **Auto Power Down Mode:** This is a stand alone PHY feature which is enabled by a register bit setting. The PHY shuts off the analog portion of the circuitry when cable is not connected or the link partner power is down.
- **Energy Efficient Ethernet (EEE) Mode:** Energy Efficient Ethernet is IEEE802.1az, an extension of the IEEE802.3 standard. IEEE defines support for the PHY to operate in Low Power Idle (LPI) mode. When enabled, this mode supports QUIET times during low link utilization, allowing the both sides of link to disable portions of each PHY's operating circuitry and save power.
- **Short Cable Mode (Green Mode):** This mode requires the CPU to run the cable diagnostics, and the CPU enables power savings mode based on the cable length measurement result.
- **Deep Green Mode:** This mode also requires the CPU to recognize the long period power down time and shut off the PHY power and the PLL to the PHY core. The BCM53128 enters normal operation and establishes a link when a signal is detected at the PHY input.

Auto Power Down Mode

Auto Power Down mode saves PHY power consumption while the link is down. When the user enables the Auto Power Down mode through a PHY register bit setting, the PHY goes into the power savings mode automatically whenever it is in linkdown state. During the Power Down state, the PHY wakes up every 2.7 or 5.4 seconds, depending on the register settings, and checks for a link signal. If no link signal is detected, then the PHY goes back to Power Down state, or the PHY wakes up and resumes the link process.

Automatic Power Down mode applies to the following conditions:

1. Cable is plugged in, but the link partner is shut down (for example, when a PC is off), so the port is in link down state.
2. Cable is unplugged, so the port is in link down state.

Energy Efficient Ethernet Mode

Energy Efficient Ethernet power savings mode saves PHY consumption while the link is up but when extended idle periods may exist between packet traffic. In EEE power savings mode PHY power consumption is scalable to the actual bandwidth utilization. The PHY can go in to "Quiet" mode (low-power idle mode) when there is no data to be transmitted. This feature is based on the latest IEEE 802.3az standard. The EEE supporting capability of the link partner is a must for this feature to work, and the discovery of the capability is during auto-negotiation through Link Layer Discovery Protocol (LLDP). This EEE feature is an embedded PHY feature and no external CPU is required.

In this mode, the MAC determines when to enter low power mode by examining the state of the transmit queues associated with each MAC. Four simple adjustments (settings) are used to trigger (optimize) the behavior of EEE control policy. These adjustments are:

- Global Buffer occupancy threshold
- Two-part sleep delay timer
- Minimum low-power idle duration timer
- Wake transition timer

The two-way communication between the PHY and its link partner is required for the PHY to achieve the power savings on both sides. The transmit PHY sends a sleep symbol to the link partner, and the link partner enters low power state. When the transmit PHY sends a wake symbol, the regular packet transfer mode resumes. For details on how the mode works and how to set up the conditions, please refer to the *Layout and Design Guide* (document number 53128-AN1xx-R).

Short Cable Mode (Green Mode)

The Short Cable Power Savings mode (called Green mode) requires a CPU. In the BCM53128, a dedicated embedded 8051 processor is used to implement this feature. Software running in the 8051 triggers the cable diagnostic routine on a schedule programmed by the user (for example, upon every power up or every new link-up). The diagnostic routine obtains the length of the cable connected to the port. Then, the CPU reduces the PHY receiver power based on the measured cable length. It is for the Giga link only and the maximum supported cable length is 30m.

Deep Green Mode

The Deep Green Power Savings mode is a step deeper than the Auto Power Down Power Savings mode. The Deep Green Power Savings mode can be enabled through the internal 8051 microcontroller by setting the En_Green strap pin high. The Auto Power Down Power Savings mode is per port, but the Deep Green Power Savings mode is per PHY core base with a common PLL. When the ports that are sharing a PLL are linked down, the Auto Power Down mode is enabled (Register Page 10h – 17h, Address 38h, Shadow 01010b), and the DLL Auto Power-Down mode is enabled (Register Page 10h – 17h, Address 38h, Shadow 00101b), then the PHYs enter the Deep Green Power Savings mode. In this mode, all the PHY circuits are powered down except the energy detection circuit, and the energy detection circuit constantly monitors the energy on the line. Upon signal energy detection, the BCM53128 enters normal operation and establishes a link if energy is detected. The Deep Green Power Savings mode is most effective when the user expects no activities on the line for a long period of time.

Section 3: System Functional Blocks

Overview of System Functional Blocks

The BCM53128 include the following blocks:

- “Media Access Controller”
- “Integrated 10/100/1000 PHY” on page 70
- “Frame Management” on page 79
- “MIB Engine” on page 83
- “Integrated High-Performance Memory” on page 90
- “Switch Controller” on page 90

Each of these is discussed in more detail in the following sections.

Media Access Controller

The BCM53128 contains six 10/100/1000 GMACs, and one MAC.

The MAC automatically selects the appropriate speed (CSMA/CD or full-duplex) based on the PHY auto-negotiation result. In full-duplex mode, IEEE 802.3x PAUSE frame-based flow control is also determined through auto-negotiation. The MAC is IEEE 802.3-, IEEE 802.3u-, and IEEE 802.3x-compliant.

Receive Function

The MAC initiates frame reception following the assertion of receive data valid indication from the physical layer. The MAC monitors the frame for the following error conditions:

- Receive error indication from the PHY
- Runt frame error if frame is fewer than 64 bytes
- CRC error
- Long frame error if frame is greater than the standard maximum frame size or 9,720 bytes for jumbo-enabled ports.

Note: Frames longer than standard max frame size which configured using Standard Max Frame Size register are considered oversized frames. When jumbo-frame mode is enabled, only the frames longer than 9,720 bytes are bad frames and dropped.

If no errors are detected, the frame is processed by the switch controller. Frames with errors are discarded. Receive functions can be disabled by writing to Port Traffic Control register.

Transmit Function

Frame transmission begins with the switch controller queuing a frame to the MAC transmitter. The frame data is transmitted as received from the switch controller. The transmit controller is responsible for preamble insertion, carrier deferral, collision backoff, and inter-packet gap enforcement.

In 10/100 Mbps half-duplex mode, when a frame is queued for transmission, the transmit controller behaves as specified by the IEEE 802.3 requirements for frame deferral. Following deferral, the transmitter adds 8 bytes of preamble and SFD to the frame data received from the switch controller. If, during frame transmission, a collision is observed and the collision window timer has not expired, the transmit controller asserts jam and then executes the backoff algorithm. The frame is retransmitted when appropriate. On the 16th consecutive collision, the backoff algorithm starts over at the initial state, the collision counter is reset and attempts to transmit the current frame continue. Following a late collision, the frame is aborted, and the switch controller is allowed to queue the next frame for transmission.

While in full-duplex mode, the transmit controller ignores carrier activity and collision indication. Transmission begins after the switch controller queues the frame, and the 96-bit times of IPG have been observed. Transmit functions can be disabled by writing to Port Traffic Control register.

Flow Control

The BCM53128 implement an intelligent flow-control algorithm to minimize the system impact resulting from traffic congestion. Buffer memory allocation is adaptive to the status of each port's speed and duplex mode, providing an optimal balance between flow management and per-port memory depth. The BCM53128 initiate flow control in response to buffer memory conditions on a per-port basis.

The MACs are capable of flow control in both full-and half-duplex modes.

10/100 Mbps Half-Duplex

In 10/100 half-duplex mode, the MAC back-pressures a receiving port by transmitting a 96-bit time jam packet to the port. A single jam packet is asserted for each received packet for the duration of the time the port is in the flow-control state.

10/100/1000 Mbps Full-Duplex

Flow control in full-duplex mode functions as specified by the IEEE 802.3x requirements. In the receiver, MAC flow-control frames are recognized and, when properly received, set the flow-control pause time for the transmit controller. The pause time is assigned from the 2-byte pause time field following the pause opcode. MAC control PAUSE frames are not forwarded from the receiver to the switch controller.

When the switch controller requests flow control, the transmit controller transmits a MAC control PAUSE frame with the pause time set to maximum. When the condition that caused the flow control state is no longer present, a second MAC control PAUSE frame is sent with the pause time field set to 0.

The flow control capabilities of the BCM53128 are enabled based on the results of auto-negotiation and the state of the ENFDXFLOW and ENHDXFLOW control signals loaded during reset. Flow control in half-duplex mode is independent of the state of the link partner flow control (IEEE 802.3x) capability. See [Table 11](#) for detailed information.

Table 11: Flow Control Modes

Link Partner Flow Control (IEEE 802.3x)	Control Input ENFDXFLOW	Control Input ENHDXFLOW	Auto-negotiated Link Speed	Flow Control Mode
X	X	0	Half-duplex	Disabled
X	X	1	Half-duplex	Jam pattern
0	0	X	Full-duplex	Disabled
0	1	X	Full-duplex	Disabled
1	0	X	Full-duplex	Disabled
1	1	X	Full-duplex	IEEE 802.3x flow control

Integrated 10/100/1000 PHY

There are eight integrated PHY blocks in the BCM53128. For more information see [“Copper Interface” on page 92](#). The following sections describe the operations of the internal PHY block.

Encoder

There are eight integrated PHY blocks in the BCM53128. The PHY is the Ethernet transceiver that appropriately processes data presented by the MAC into an analog data stream to be transmitted at the MDI interface, which performs the reverse process on data received at the MDI interface. The registers of the PHY are read using the [“Programming Interfaces” on page 95](#). The following sections describe the operations of the internal PHY block. For more information, see [“Copper Interface” on page 92](#).

In 10BASE-T mode, Manchester encoding is performed on the data stream that is transmitted on the twisted-pair cable. The multimode transmit digital-to-analog converter (DAC) performs preequalization for 100m of Category 3 cabling.

In 100BASE-TX mode, the BCM53128 transmits a continuous data stream over the twisted-pair cable. The transmit packet is encapsulated by replacing the first two nibbles of preamble with a start-of-stream delimiter (/J/K codes) and appending an end-of-stream delimiter (/T/R codes) to the end of the packet. The transmitter repeatedly sends the idle code group between packets. The encoded data stream is serialized and then scrambled by the stream cipher block, as described in [“Stream Cipher” on page 73](#). The scrambled data is then encoded into MLT3 signal levels.

In 1000BASE-T mode, the BCM53128 simultaneously transmits and receives a continuous data stream on all 4 pairs of the Category 5 cable. Byte-wide data from the transmit data pins is scrambled when the transmit enable is asserted, and the trellis (a PAM5 symbol on each of the four twisted-pairs) is encoded into a four-dimensional code group and then inserted into the transmit data stream. The transmit packet is encapsulated by replacing the first 2 bytes of the preamble with a start-of-stream delimiter, and appending an end-of-stream delimiter to the end of the packet. When the transmit error input is asserted during a packet transmission, a transmit error code group is sent in place of the corresponding data code group. The transmitter sends idle code groups or carrier extend code groups between packets. Carrier extension is used by the MAC to separate packets within a multiple-packet burst and is indicated by asserting the transmit error signal and placing 0Fh on the transmit data pins while the transmit enable is low. A carrier extend error is indicated by replacing the transmit data input with 1Fh during carrier extension.

The encoding complies with IEEE standard IEEE 802.3ab and is fully compatible with previous versions of the Broadcom 1000BASE-T PHYs.

Decoder

In 10BASE-T mode, Manchester decoding is performed on the data stream.

In 100BASE-TX mode, following equalization and clock recovery, the receive data stream is converted from MLT3 to serial nonreturn-to-zero (NRZ) data. The NRZ data is descrambled by the stream cipher block, as described later in this document. The descrambled data is then deserialized and aligned into 5-bit code groups. The 5-bit code groups are decoded into 4-bit data nibbles. The start-of-stream delimiter is replaced with preamble nibbles, and the end-of-stream delimiter and idle codes are replaced with 0h. The decoded data is driven onto the MII receive data pins. When an invalid code group is detected in the data stream, the BCM53128 asserts the MII receive error (RX_ER) signal. RX_ER is also asserted when the link fails, or when the descrambler loses lock during packet reception.

In 1000BASE-T mode, the receive data stream is:

- Passed through the Viterbi decoder
- Descrambled
- Translated back into byte-wide data

The start-of-stream delimiter is replaced with preamble bytes, and the end-of-stream delimiter and idle codes are replaced with 00h. Carrier extend codes are replaced with 0Fh or 1Fh. Decoding complies with IEEE standard IEEE 802.3ab and is fully compatible with previous versions of Broadcom 1000BASE-T PHYs.

Link Monitor

In 10BASE-T mode, a link-pulse detection circuit constantly monitors the TRD pins for the presence of valid link pulses.

In 100BASE-TX mode, receive signal energy is detected by monitoring the receive pair for transitions in the signal level. Signal levels are qualified using squelch detect circuits. When no signal is detected on the receive pair, the link monitor enters the Link Fail state and the transmission and reception of data packets is disabled. When a valid signal is detected on the receive pair for a minimum of 1 ms, the link monitor enters the Link Pass state, and the transmit and receive functions are enabled.

Following auto-negotiation in 1000BASE-T mode, the master transceiver begins sending data on the media. The slave transceiver also begins transmitting when it has recovered the master transceiver's timing. Each end of the link continuously monitors its local receiver status. When the local receiver status has been good for at least 1 microsecond, the link monitor enters the Link Pass state, and the transmission and reception of data packets are enabled. When the local receiver status is bad for more than 750 ms, the link monitor enters the Link Fail state and the transmission and reception of data packets are disabled.

Digital Adaptive Equalizer

The digital adaptive equalizer removes intersymbol interference (ISI) created by the transmission channel media. The equalizer accepts sampled unequalized data from the analog-to-digital converter (ADC) on each channel and produces equalized data. The BCM53128 achieves an optimum signal-to-noise ratio by using a combination of feed forward equalization (FFE) and decision feedback equalization (DFE) techniques. Under harsh noise environments, these powerful techniques achieve a bit error rate (BER) of less than 1×10^{-12} for transmissions up to 100m on Category 5 twisted-pair cabling (100m on Category 3 UTP cable for 10BASE-T mode). The all-digital nature of the design makes the performance very tolerant to noise. The filter coefficients are self-adapting to accommodate varying conditions of cable quality and cable length.

Echo Canceled

Because of the bidirectional nature of the channel in 1000BASE-T mode, an echo impairment is caused by each transmitter. The output of the echo filter is added to the FFE output to remove the transmitted signal impairment from the incoming receive signal. The echo canceler coefficients are self-adapting to manage the varying echo impulse responses caused by different channels, transmitters, and environmental conditions.

Cross Talk Canceled

The BCM53128 transmits and receives a continuous data stream on four channels. For a given channel, the signals sent by the other three local transmitters cause impairments on the received signal because of near-end crosstalk (NEXT) between the pairs. It is possible to cancel the effect because each receiver has access to the data for the other three pairs that cause this interference. The output of the adaptive NEXT canceling filters is added to the FFE output to cancel the NEXT impairment.

Analog-to-Digital Converter

Each receive channel has its own 125-MHz analog-to-digital converter (ADC) that samples the incoming data on the receive channel and feeds the output to the digital adaptive equalizer. Advanced analog circuit techniques achieve the following results:

- Low offset
- High power-supply noise rejection
- Fast settling time
- Low bit error rate

Clock Recovery/Generator

The clock recovery and generator block creates the transmit and receive clocks for 1000BASE-T, 100BASE-TX, and 10BASE-T operation.

In 10BASE-T or 100BASE-TX mode, the transmit clock is locked to the 25-MHz crystal input, and the receive clock is locked to the incoming data stream.

In 1000BASE-T mode, the two ends of the link perform loop timing. One end of the link is configured as the master, and the other is configured as the slave. The master transmit and receive clocks are locked to the 25-MHz crystal input. The slave transmit and receive clocks are locked to the incoming receive data stream. Loop timing allows for the cancellation of echo and NEXT impairments by ensuring that the transmitter and receiver at each end of the link are operating at the same frequency.

Baseline Wander Correction

1000BASE-T and 100BASE-TX data streams are not always DC-balanced. Because the receive signal must pass through a transformer, the DC offset of the differential receive input can vary with data content. This effect, which is known as baseline wander, can greatly reduce the noise immunity of the receiver. The BCM53128 automatically compensates for baseline wander by removing the DC offset from the input signal, thereby significantly reducing the probability of a receive symbol error.

In 10BASE-T mode, baseline wander correction is not performed because the Manchester coding provides a perfect DC balance.

Multimode TX Digital-to-Analog Converter

The multimode transmit digital-to-analog converter (DAC) transmits PAM5, MLT3, and Manchester coded symbols. The transmit DAC performs signal wave shaping that decreases the unwanted high frequency signal components, reducing electromagnetic interference (EMI). The transmit DAC uses a voltage driven output with internal terminations and hence, does not require external components or magnetic supply for operation thus reducing system complexity for routing and bill of materials.

Stream Cipher

In 1000BASE-T and 100BASE-TX modes, the transmit data stream is scrambled to reduce radiated emissions and to ensure that there are adequate transitions within the data stream. The 1000BASE-T scrambler also ensures that there is no correlation among symbols on the four different wire pairs and in the transmit and receive data streams. The scrambler reduces peak emissions by randomly spreading the signal energy over the transmit frequency range and eliminating peaks at certain frequencies. The randomization of the data stream also assists the digital adaptive equalizers and echo/crosstalk cancelers. The algorithms in these circuits require there to be no sequential or cross-channel correlation among symbols in the various data streams.

In 100BASE-TX mode, the transmit data stream is scrambled by exclusive ORing the encoded serial data stream. This is done with the output of an 11-bit wide linear feedback shift register (LFSR), producing a 2047-bit nonrepeating sequence.

In 1000BASE-T mode, the transmit data stream is scrambled by exclusive ORing the input data byte with an 8-bit wide cipher text word. The cipher text word generates each symbol period from eight uncorrelated maximal length data sequences that are produced by linear remapping of the output of a 33-bit wide LFSR. After the scrambled data bytes are encoded, the sign of each transmitted symbol is again randomized by a 4-bit wide cipher text word that is generated in the same manner as the 8-bit word. The master and slave transmitters use different scrambler sequences to generate the cipher text words. For repeater or switch applications, where all ports can transmit the same data simultaneously, signal energy is randomized further by using a unique seed to initialize the scrambler sequence for each PHY.

The receiver descrambles the incoming data stream by exclusive ORing it with the same sequence generated at the transmitter. The descrambler detects the state of the transmit LFSR by looking for a sequence representing consecutive idle code groups. The descrambler locks to the scrambler state after detecting a sufficient number of consecutive idle codes. The BCM53128 enables transmission and reception of packet data only when the descrambler is locked. The receiver continually monitors the input data stream to ensure that it has not lost synchronization by checking that inter-packet gaps containing idles or frame extensions are received at expected intervals. When the BCM53128 detects loss of synchronization, it notifies the remote PHY of the inability to receive packets (1000BASE-T mode only) and attempts to resynchronize to the received data stream. If the descrambler is unable to resynchronize for a period of 750 ms, the BCM53128 is forced into the Link Fail state.

In 10BASE-T mode, scrambling is not required to reduce radiated emissions.

Wire Map and Pair Skew Correction

During 1000BASE-T operation, the BCM53128 has the ability to automatically detect and correct some UTP cable wiring errors. The symbol decoder detects and compensates for (internal to the BCM53128) the following errors:

- Wiring errors caused by the swapping of pairs within the UTP cable.
- Polarity errors caused by the swapping of wires within a pair.

The BCM53128 also automatically compensates for differences in the arrival times of symbols on the four pairs of the UTP cable. The varying arrival times are caused by differing propagation delays (commonly referred to as delay skew) between the wire pairs. The BCM53128 can tolerate delay skews of up to 64 ns long. Auto-negotiation must be enabled to take advantage of the wire map correction.

During 10/100 Mbps operation, pair swaps are corrected. Delay skew is not an issue though, because only one pair of wires is used in each direction.

Automatic MDI Crossover

During copper auto-negotiation, one end of the link needs to perform an MDI crossover so that each transceiver's transmitter is connected to the other receiver. The BCM53128 can perform an automatic media-dependent interface (MDI) crossover, eliminating the need for crossover cables or cross-wired (MDIX) ports. During auto-negotiation, the BCM53128 normally transmits and receives on the TRD pins.

When connecting to another device that does not perform MDI crossover, the BCM53128 automatically switches its TRD in pairs when necessary to communicate with the remote device. When connecting to another device that does have MDI crossover capability, an algorithm determines which end performs the crossover function.

During 1000BASE-T operation, the BCM53128 swaps the transmit symbols on pairs 0 and 1 and pairs 2 and 3 if auto-negotiation completes in the MDI crossover state. The 1000BASE-T receiver automatically detects pair swaps on the receive inputs and aligns the symbols properly within the decoder. The automatic MDI crossover function cannot be disabled when in 1000BASE-T mode. During 10BASE-TX and 100BASE-T operation, pair swaps automatically occur within the device and do not require user intervention. The automatic MDI crossover function by default only works when auto-negotiation is enabled. This function can be disabled during auto-negotiation by writing 1 to bit 14 of the PHY Extended Control register.

Note: This function only operates when the copper auto-negotiation is enabled.

10/100BASE-TX Forced Mode Auto-MDIX

The automatic MDI crossover function can also be enabled when in forced 10BASE-T or forced 100BASE-TX mode. This feature allows the user to disable the copper auto-negotiation in either 10BASE-T or 100BASE-TX and still take advantage of the automatic MDI crossover function. Whenever the forced link is down for at least 4 seconds, then auto-negotiation is internally enabled with its automatic MDI crossover function until link pulses or 100Tx idles are detected. Once detected, the PHY returns to forced mode operation.

The user should set the same speed in register 0 and the auto-negotiation advertisement register 4.

Note: This function only operates when the copper auto-negotiation is disabled.

Resetting the PHY

The BCM53128 provides a hardware reset pin, $\overline{\text{RESET}}$, which resets all internal nodes to a known state. Hardware reset is accomplished by holding the $\overline{\text{RESET}}$ pin low for at least 1 ms. Once $\overline{\text{RESET}}$ is brought high, the PHY will complete its reset sequence within 5 ms. All outputs will be inactive until the PHY has completed its reset sequence. The PHY will keep the inputs inactive for 5 ms after the deassertion of hardware reset. The hardware configuration pins and the PHY address pins will be read on the deassertion of hardware reset.

The BCM53128 also has a software reset capability. To enable the software reset, a 1 must be written to the bit. This bit is self-clearing, meaning that a second write operation is not necessary to end the reset. There is no effect if 0 is written to this bit. Mode pins that are labelled sample on reset (SOR) are latched during hardware reset. Similarly, software resets also latch new values for the SOR mode pins.

PHY Address

The BCM53128 has eight unique PHY addresses for MII management of the internal PHYs. The PHY addresses for each port are as follows,

- PHY address for Port 0 is 0
- PHY address for Port 1 is 1
- PHY address for Port 2 is 2
- PHY address for Port 3 is 3
- PHY address for Port 4 is 4
- PHY address for Port 5 is 5
- PHY address for Port 6 is 6
- PHY address for Port 7 is 7

Super Isolate Mode

When in Super Isolate mode, the transmit and receive functions on the Copper Media Dependent Interface are disabled (No link will be established with the PHY's copper link partner). Any data received from the switch will be ignored by the BCM53128 and no data will be sent from the BCM53128.

Standby Power-Down Mode

The BCM53128 can be placed into standby power-down mode using software commands. In this mode, all PHY functions except for the serial management interface are disabled. To enter standby power-down mode, set MII Control register (Page 10h–17h: Address 00h), bit 11 = 1. There are three ways to exit standby power-down mode:

- Clear MII Control register (address 00h), bit 11 = 0.
- Set the software RESET bit 15, MII Control register (Page 10h–17h: Address 00h).
- Assert the hardware $\overline{\text{RESET}}$ pin.

Read or write operations to any MII register, other than MII Control register, while the device is in the standby power-down mode returns unpredictable results. Upon exiting standby power-down mode, the BCM53128 remains in an internal reset state for 40 μs and then resumes normal operation.

Auto Power-Down Mode

The BCM53128 can be placed into auto power-down mode. Auto power-down mode reduces device power when the signal from the copper link partner is not present. The auto power-down mode works whether the device is in Auto-negotiation Enabled or Forced mode. This mode is enabled by setting bit 5 =1 of Auto Power-Down register. When auto power-down mode is enabled, the BCM53128 automatically enters the low-power mode when energy on the line is lost, and it resumes normal operation when energy is detected. When the BCM53128 is in auto power-down mode, it wakes up after 2.7s or 5.4s, which determined by bit 4 of Auto Power-Down register, and sends link pulses while monitoring for energy from the link partner. The BCM53128 enters normal operation and establishes a link if energy is detected, otherwise the wake-up mode continues for a duration of 84 ms to 1260 ms. This is determined by the timer bits [3:0] of Auto Power-Down register. before going back to low-power mode.

External Loopback Mode

The External Loopback mode allows in-circuit testing of the BCM53128 as well as the transmit path through the magnetics and the RJ-45 connector. External loopback can be performed with and without a jumper block. External loopback with a jumper block tests the path through the magnetics and RJ-45 connector. External loopback without the jumper block only tests the BCM53128's transmit and receive circuitry. In 1000BASE-T, 100BASE-TX, and 10BASE-T modes, a jumper block must be inserted into the RJ-45 connector to support external loopback. The jumper block should have the following RJ-45 pins connected together:

1-----3
2-----6
4-----7
5-----8

Table 12 to Table 17 on page 78 describe how the external loopback is enabled for 1000BASE-T, 100BASE-TX, and 10BASE-T modes with and without a jumper block.

Table 12: 1000BASE-T External Loopback with External Loopback Plug

Register Writes	Comments
Write 1800h to 1000BASE-T Control register	Enable 1000BASE-T Master Mode
Write 0040h to MII Control register	Enable Force 1000BASE-T
Write 8400h to Auxiliary Control register	Enable External Loopback Mode with external loopback plug

Register Writes	Comments
Write 0100h to MII Control register	Enable Force 10BASE-T full-duplex mode
Write 0014h to Auxiliary Control register	Enable external loopback mode without external loopback plug

Note: To exit the External Loopback mode, a software or hardware reset is recommended.

Full-Duplex Mode

The BCM53128 supports full-duplex operation. While in full-duplex mode, a transceiver can simultaneously transmit and receive packets on the cable.

Copper Mode

When auto-negotiation is disabled, full-duplex operation can be enabled by setting bit 8 of MII Control register.

When auto-negotiation is enabled, the full-duplex capability is advertised for:

- 10BASE-T when bit 6 of Auto-Negotiation Advertisement register is set.
- 100BASE-T when bit 8 Auto-Negotiation Advertisement register is set.
- 1000BASE-T when bit 9 of 1000BASE-T Control register is set.

Master/Slave Configuration

In 1000BASE-T mode, the BCM53128 and its link partner perform loop timing. One end of the link must be configured as the timing master, and the other end as the slave. Master/slave configuration is performed by the auto-negotiation function. The auto-negotiation function first looks at the manual master/slave configuration bits advertised by the local PHY and the link partner. If neither PHY requests manual configuration, then the auto-negotiation function looks at the advertised repeater/DTE settings. If one PHY is advertised as a repeater port and the other is advertised as a DTE port, then the repeater port is configured as the master and the DTE port as the slave. Each end generates an 11-bit random seed if the two settings are equal, and the end with the higher seed is configured as the master. If the local PHY and the link partner generate the same random seed, then auto-negotiation is restarted.

If both ends of the link attempt to force the same manual configuration (both master or both slave), or the random seeds match seven consecutive times, then the BCM53128 sets the Master/Slave Configuration Fault bit in the 1000BASE-T Status register, and auto-negotiation is restarted. This is used to set the BCM53128 to manual master/slave configuration or to set the advertised repeater/DTE configuration.

Next Page Exchange

The 1000BASE-T configuration requires the exchange of three auto-negotiation next pages between the BCM53128 and its link partner. Exchange of 1000BASE-T Next Page information takes place automatically when the BCM53128 is configured to advertise 1000BASE-T capability.

The BCM53128 also supports software controlled Next Page exchanges. This includes the three 1000BASE-T Next Pages, which are always sent first. The BCM53128 automatically generates the appropriate message code field for the 1000BASE-T pages. When the BCM53128 is not configured to advertise 1000BASE-T capability, the 1000BASE-T Next Pages are not sent.

When the BCM53128 is not configured to advertise 1000BASE-T capability and bit 15 of the Auto-Negotiation Advertisement register is set, the BCM53128 does not advertise Next Page ability.

Frame Management

The BCM53128 provides a Frame Management block that works in conjunction with one of the GMII ports operate in IMP mode as the full duplex packet streaming interface to the external CPU, with in-band messaging mechanism for management purpose.

In-Band Management Port

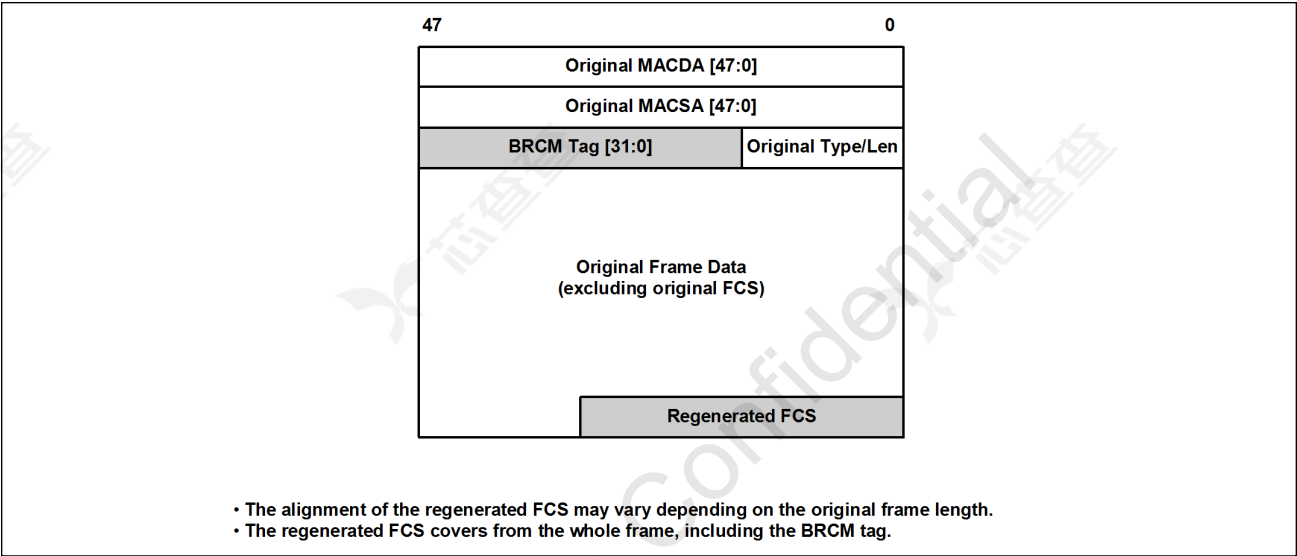

The GMII port can be configured as the management port, using the Frame Management Port bits in the Global Management Configuration register. When the GMII port is defined as the Frame Management Port, it is referred to as the in-band management port (IMP).

The IMP can be used as a full-duplex 10/100/1000-Mbps port, which can be used to forward management information to the external management agent, such as BPDUs, mirrored frames, or frames addressed to other static address entries that have been identified as a special interest to the management system.

As IMP is defined as the frame management port, normal frame data is forwarded to the port based on the state of the RX_UCST_EN, RX_MCST_EN and RX_BCST_EN bits in the IMP Port Control register. If these bits are cleared, no frame data will be forwarded to the Frame Management Port, with the exception that frames meeting the mirror ingress/egress rules criteria, will always be forwarded to the designated frame management port.

Packets transferred over the IMP port are tagged with the Broadcom proprietary header to carry the necessary information which is of interest to the management entity running on the CPU, as shown below, except for the PAUSE frame. The IMP port must support normal Ethernet pause based flow control mechanism.

Figure 10: IMP Packet Encapsulation Format

The BRCM tag is designed for asymmetric operation across the IMP port. The information carried from the switching device to the CPU is different from the information carried from the CPU to the switching device.

Similarly, the host system must insert the BRCM tag fields into frames it wished to send into the management port, to be routed to specific egress ports. The OPCODE within the tag field determines how the frame is handled, and allows frames to be forwarded using the normal address lookup using a port ID designation within the tag.

The BRCM tag are transmitted with the convention of highest significant octet first, followed by the next lowest significant octet, and so on, with the least significant bit of each octet transmitted out from the MAC first. So, for the BRCM tag field in [Table 18 on page 81](#) the most significant octet would be transmitted first (bits [24:31]), with bit 24 being the first bit transmitted.

Broadcom Tag Format for Egress Packet Transfer

When a packet is forwarded by the switching device to the external CPU for processing, the BRCM tag is formatted as shown in [Table 18](#).

Table 18: Egress Broadcom Tag Format (IMP to CPU)

31–29	28–24	23–16	15–8	7–5	4–0
OPCODE = 000	Reserved	Reserved	REASON_CODE[7:0]	TC[2:0]	SRC_PID[4:0]
63–61	60–38			37	36–32
OPCODE = 001	Reserved			T/R	T/R_PID[4:0]
31–0					
TIME_STAMP[31:0]					

- **OPCODE 000**

This indicates the packet transfer with explicit reasons to help the external CPU to direct the packet for the appropriate packet processing entities.

- **REASON_CODE [7:0]**

This indicates the reasons why the packet is forwarded to the external CPU so that the CPU can identify the appropriate software routines for packet processing.

- Bit [0] indicates mirroring
- Bit [1] indicates SA learning
- Bit [2] indicates switching
- Bit [3] indicates protocol termination
- Bit [4] indicates protocol snooping
- Bit [5] indicates flooding/exception processing
- Bit [6] and Bit[7] are reserved

- **TC [2:0]**

This indicates the traffic class classified by the switching device when forwarding the packet to the CPU.

- **SRC_PID [4:0]**

This indicates the ingress port of the switching device where the packet is received.

- **OPCODE 001**

This indicates a packet transfer with explicit time stamp recorded at the port where it was transmitted or received (indicated by the T/R_PID) for IEEE 802.1as protocol implementation.

- **T/R**

This indicates the type of time stamp. 0 indicates the time stamp recorded when the packet was received through the port (indicated by the T/R_PID); 1 indicates the time stamp recorded when the packet was transmitted through the port (indicated by the T/R_PID).

- **T/R_PID [4:0]**
This indicates the port through which the packet was transmitted when T/R = 1, or the port through which the packet was received when T/R = 0.
- **TIME_STAMP [31:0]**
This carries the time stamp value recorded at the ingress port for a received TS protocol packet.

Broadcom Tag Format for Ingress Packet Transfer

For packet transfer from the external CPU to the switching device, the BRCM tag is formatted as shown below.

Table 19: Ingress BRCM Tag (CPU to IMP)

31–29	28–26	25–24	23–0	
OPCODE = 000	TC[2:0]	TE[1:0]	Reserved	
31–29	28–26	25–24	23	22–0
OPCODE = 001	TC[2:0]	TE[1:0]	TS	DST_MAP[22:0]

- **OPCODE 000**
It indicates that the external CPU is not dictating how the packet is forwarded, and the packet is forwarded by the switching device based on the original Ethernet packet information.
- **OPCODE 001**
This indicates the packet is forwarded to multiple (or single) egress ports by the switching device based on the explicit direction of the external CPU.
- **DST_MAP [22:0]**
This indicates the egress port bit map to which the external CPU intends to forward the packet.
- **TC [2:0]**
This indicates the traffic class with which the external CPU intends to forward the packet.
- **TS (time stamp request)**
This indicates whether the transmit time stamped at the egress port should be reported back to the external CPU.
- **TE (tag enforcement)**
This indicates the 802.1Q/P tagging/untagging encapsulation enforcement for the packet transmission.
00: No enforcement (follow VLAN untag mask rules)
01: Untag enforcement
10: Tag enforcement
11: Reserved

MIB Engine

The MIB Engine is responsible for processing status words received from each port. Based on whether it is a receive status or transmit status, appropriate MIB counters are updated. The BCM53128 implement 70-plus MIB counters on a per-port basis. MIB counters can be categorized into three groups: receive-only counters, transmit-only counters, and receive or transmit counters. This latter group can, as a group, be selectively steered to the receive or transmit process on a per-port basis. The section below describes each individual counter.

The BCM53128 offers the MIB snapshot feature per port enabled. A snapshot of a selected port MIB registers can be captured and available to the users while MIB counters are continuing to count.

MIB Counters Per Port

Receive Only Counter (19) Description of Counter

Table 20: Receive Only Counter (19) Description of Counter

Field	Description
RxDropPkts (32 bit)	The number of good packets received by a port that were dropped due to a lack of resources (e.g., lack of input buffers) or were dropped due to a lack of resources before a determination of the validity of the packet was able to be made (e.g., receive FIFO overflow). The counter is only incremented if the receive error was not counted by the RxExcessSizeDisc, the RxAlignmentErrors, or the RxFCSErrors counters.
RxOctets (64 bit)	The number of data bytes received by a port (excluding preamble, but including FCS), including bad packets.
RxBroadcastPkts (32 bit)	The number of good packets received by a port that are directed to the broadcast address. This counter does not include errored broadcast packets or valid multicast packets. The maximum packet size can be programmed.
RxMulticastPkts (32 bit)	The number of good packets received by a port that are directed to a multicast address. This counter does not include errored multicast packets or valid broadcast packets. The maximum packet size can be programmed.
RxSACHanges (32 bit)	The number of times the SA of good receive packets has changed from the previous value. A count greater than 1 generally indicates the port is connected to a repeater-based network. The maximum packet size can be programmed.
RxUndersizePkts (32 bit)	The number of good packets received by a port that are less than 64 bytes long (excluding framing bits, but including the FCS).
RxOversizePkts (32 bit)	The number of good packets received by a port that are greater than standard max frame size. The maximum packet size can be programmed.
RxFragments (32 bit)	The number of packets received by a port that are less than 64 bytes (excluding framing bits) and have either an FCS error or an alignment error.
RxJabbers (32 bit)	The number of packets received by a port that are longer than 1522 bytes and have either an FCS error or an alignment error.
RxUnicastPkts (32 bit)	The number of good packets received by a port that are addressed to a unicast address. The maximum packet size can be programmed.

Table 20: Receive Only Counter (19) Description of Counter (Cont.)

Field	Description
RxAlignmentErrors (32 bit)	The number of packets received by a port that have a length (excluding framing bits, but including FCS) between 64 and standard max frame size, inclusive, and have a bad FCS with a nonintegral number of bytes.
RxFCSErrors (32 bit)	The number of packets received by a port that have a length (excluding framing bits, but including FCS) between 64 and standard max frame size, inclusive, and have a bad FCS with an integral number of bytes.
RxGoodOctets (64 bit)	The total number of bytes in all good packets received by a port (excluding framing bits, but including FCS). The maximum packet size can be programmed.
JumboPktCount (32 bit)	The number of good packets received by a port that are greater than the standard maximum size and less than or equal to the jumbo packet size, regardless of CRC or alignment errors.
RxPausePkts (32 bit)	The number of PAUSE frames received by a port. The PAUSE frame must have a valid MAC Control Frame EtherType field (88–08h), have a destination MAC address of either the MAC Control frame reserved multicast address (01-80-C2-00-00-01) or the unique MAC address associated with the specific port, a valid PAUSE opcode (00–01), be a minimum of 64 bytes in length (excluding preamble but including FCS), and have a valid CRC. Although an IEEE 802.3-compliant MAC is only permitted to transmit PAUSE frames when in full-duplex mode with flow control enabled and with the transfer of PAUSE frames determined by the result of auto-negotiation, an IEEE 802.3 MAC receiver is required to count all received PAUSE frames, regardless of its half/full-duplex status. An indication that a MAC is in half-duplex with the RxPausePkts incrementing indicates a noncompliant transmitting device on the network.
RxSymbolErrors (32 bit)	The total number of times a valid-length packet was received at a port and at least one invalid data symbol was detected. The counter only increments once per carrier event and does not increment on detection of a collision during the carrier event.
RxDiscard (32 bit)	The number of good packets received by a port that were discarded by the Forwarding Process.
InRangeErrors (32 bit)	The number of packets received with good CRC and one of the following: (1) The value of length/type field is between 46 and 1500 inclusive, and does not match the number of (MAC client data + PAD) data octets received, OR (2) The value of length/type field is less than 46, and the number of data octets received is greater than 46 (which does not require padding).
OutOfRangeErrors (32 bit)	The number of packets received with good CRC and the value of length/type field is greater than 1500 and less than 1536.

Transmit Counters Only (19) Description of Counter

Table 21: Transmit Counters Only (19) Description of Counter

Field	Description
TxDropPkts (32 bit)	This counter is incremented every time a transmit packet is dropped due to lack of resources (e.g., transmit FIFO underflow), or an internal MAC sublayer transmit error not counted by either the TxLateCollision or the TxExcessiveCollision counters.
TxOctets (64 bit)	The total number of good bytes of data transmitted by a port (excluding preamble but including FCS).
TxBroadcastPkts (32 bit)	The number of good packets transmitted by a port that are directed to a broadcast address. This counter does not include errored broadcast packets or valid multicast packets.
TxMulticastPkts (32 bit)	The number of good packets transmitted by a port that are directed to a multicast address. This counter does not include errored multicast packets or valid broadcast packets.
TxCollisions (32 bit)	The number of collisions experienced by a port during packet transmissions.
TxUnicastPkts (32 bit)	The number of good packets transmitted by a port that are addressed to a unicast address.
TxSingleCollision (32 bit)	The number of packets successfully transmitted by a port that have experienced exactly one collision.
TxMultipleCollision (32 bit)	The number of packets successfully transmitted by a port that have experienced more than one collision.
TxDeferredTransmit (32 bit)	The number of packets transmitted by a port for which the first transmission attempt is delayed because the medium is busy. This only applies to the Half Duplex mode, while the Carrier Sensor Busy.
TxLateCollision (32 bit)	The number of times that a collision is detected later than 512 bit-times into the transmission of a packet.
TxExcessiveCollision (32 bit)	The number of packets that are not transmitted from a port because the packet experienced 16 transmission attempts.
TxPausePkts (32 bit)	The number of PAUSE events at each port.
TxFramelnDisc (32 bit)	The number of valid packets received which are discarded by the forwarding process due to lack of space on an output queue (not maintained or reported in the MIB counters). Located in the Congestion Management registers (Page 0Ah). This attribute only increments if a network device is not acting in compliance with a flow control request, or the BCM53128 internal flow-control/buffering scheme has been configured incorrectly.
TxQ0PKT(32 bit)	The total number of good packets transmitted on COS0, which is specified in MIB queue select register when QoS is enabled.
TxQ1PKT(32 bit)	The total number of good packets transmitted on COS1, which is specified in MIB queue select register when QoS is enabled.
TxQ2PKT(32 bit)	The total number of good packets transmitted on COS2, which is specified in MIB queue select register when QoS is enabled.
TxQ3PKT(32 bit)	The total number of good packets transmitted on COS3, which is specified in MIB queue select register when QoS is enabled.
TxQ4PKT(32 bit)	The total number of good packets transmitted on COS4, which is specified in MIB queue select register when QoS is enabled.

Table 21: Transmit Counters Only (19) Description of Counter (Cont.)

Field	Description
TxQ5PKT(32 bit)	The total number of good packets transmitted on COS5, which is specified in MIB queue select register when QoS is enabled.

Transmit or Receive Counters (10) Description of Counter

Table 22: Transmit or Receive Counters (10) Description of Counter

Field	Description
Pkts64Octets (32 bit)	The number of packets (including error packets) that are 64 bytes long.
Pkts65to127Octets (32 bit)	The number of packets (including error packets) that are between 65 and 127 bytes long.
Pkts128to255Octets (32 bit)	The number of packets (including error packets) that are between 128 and 255 bytes long.
Pkts256to511Octets (32 bit)	The number of packets (including error packets) that are between 256 and 511 bytes long.
Pkts512to1023Octets (32 bit)	The number of packets (including error packets) that are between 512 and 1023 bytes long.
Pkts1024toMaxPktOctets (32 bit)	The number of packets that (include error packets) are between 1024 and the standard maximum packet size inclusive.

The total number of counters per port is 43.

Table 23 identifies the mapping of the BCM53128 MIB counters and their generic mnemonics to the specific counters and mnemonics for each of the key IETF MIBs that are supported. Direct mappings are defined. However, there are several additional statistics counters, which are indirectly supported that make up the full complement of the counters required to fully support each MIB. These are shown in Table 24 on page 88.

Finally, Table 25 on page 89 identifies the additional counters supported by the BCM53128 and references the specific standard or reason for the inclusion of the counter.

Note 1	—	—	—	etherStatsPkts
Note 1	—	—	—	etherStatsCRCAlignErrors
Note 4	dot3StatsSQETestErrors	—	—	—

Note 1: Derived by summing two or more of the supported counters. See [Table 24](#) for specific details.

Note 2: Extensions required by recent standards developments or BCM53128 operation specifics.

Note 3: The MIB II interfaces specification for if OutOctets includes preamble/SFD and errored bytes. Because IEEE 802.3-compliant MACs have no requirement to keep track of the number of transmit bytes in an errored frame, this count is impossible to maintain. The TxOctets counter maintained by the BCM53128 is consistent with good bytes transmitted, excluding preamble, but including FCS. The count can be adjusted to more closely match the if OutOctets definition by adding the preamble for TxGoodPkts and possibly an estimate of the octets involved in TxCollisions and TxLateCollision.

Note 4: The attributes TxCarrierSenseErrors and TxSQETestErrors are not supported in the BCM53128. These attributes were originally defined to support coax-based AUI transceivers. The BCM53128 integrated transceiver design means these error conditions are eliminated. MIBs intending to support such counters should return a value of 0 (not supported).

Table 24: Indirectly Supported MIB Counters

BCM53128 MIB	Ethernet-Like MIB RFC 1643	Bridge MIB RFC 1493	MIB II Interface RFC 1213/1573	RMON MIB RFC 1757
RxErrorPkts = RxAlignmentErrors + RxFCSerrors + RxFragments + RxOversizePkts + RxJabbers	—	—	ifInErrors	—
	—	—	ifInUnknownProtos	—

Table 24: Indirectly Supported MIB Counters (Cont.)

BCM53128 MIB	Ethernet-Like MIB RFC 1643	Bridge MIB RFC 1493	MIB II Interface RFC 1213/1573	RMON MIB RFC 1757
RxGoodPkts = RxUnicastPkts + RxMulticastPkts + RxBroadcastPkts	—	dot1dTpPortIn Frames	—	—
DropEvents = RxDropPkts + TxDropPkts	—	—	—	etherStatsDrop Events
RxTotalPkts = RxGoodPkts + RxErrorPkts	—	—	—	etherStatsPkts
RxCRCAlignErrors = RxCRCErrors + RxAlignmentErrors	—	—	—	etherStatsCRCAlign Errors
—	dot3StatsSQETest Errors	—	—	—
RxFramesTooLong = RxOversizePkts + RxJabber	dot3StatsFrameToo Longs	—	—	—
TxGoodPkts = TxUnicastPkts + TxMulticastPkts + TxBroadcastPkts	—	dot1dTpPortOut Frames	—	—
TxErrorPkts = TxExcessiveCollision + TxLateCollision Note 1	—	—	ifOutErrors	—

Note 1: The number of packets transmitted from a port that experienced a late collision or excessive collisions. While some media types operate in half-duplex mode, frames that experience carrier sense errors are also summed in this counter. The BCM53128 integrated design means this error condition is eliminated.

Table 25: BCM53128 Supported MIB Extensions

BCM53128 MIB	Appropriate Standards Reference
RxSACHanges	IEEE 802.3u Clause 30—Repeater Port Managed Object Class aSourceAddressChanges.
RxExcessSizeDisc	The BCM53128 cannot store packets in excess of 1536 bytes (excluding preamble/ SFD, but inclusive of FCS). This counter indicates packets that were discarded by the BCM53128 due to excessive length.
RxPausePkts	IEEE 802.3x Clause 30—PAUSE Entity Managed Object Class aPAUSEMACCtrlFramesReceived.
RxSymbolErrors	IEEE 802.3u Clause 30—Repeater Port Managed Object Class aSymbolErrorDuringPacket.
TxFramelnDisc	Internal diagnostic use for optimization of flow control and buffer allocation algorithm.

Table 25: BCM53128 Supported MIB Extensions (Cont.)

BCM53128 MIB	Appropriate Standards Reference
TxPausePkts	The number of PAUSE events at a given port.

Integrated High-Performance Memory

The BCM53128 embeds a 192 KB high-performance SRAM for storing packet data. This eliminates the need for external memory and allows for the implementation of extremely low-cost systems.

The internal RAM controller efficiently executes memory transfers and achieves nonblocking performance for stand-alone 8-port applications.

Switch Controller

The core of the BCM53128 devices is a cost-effective and high-performance switch controller. The controller manages packet forwarding between the MAC receive and transmit ports through the frame buffer memory with a store and forward architecture. The switch controller encompasses the functions of buffer management, memory arbitration, and transmit descriptor queueing.

Buffer Management

The frame buffer memory is divided into pages (units of data consisting of 256 bytes each). Each received packet may be allocated more than one page. For example, six pages are required to store a 1522-byte frame. Frame data is stored in the buffer memory as the packet is received. After reception, the frame is queued to the egress port(s) transmit queue. This list tracks the transmission of the packet. After successful packet transmission, the buffer memory is released to the free buffer pool.

Memory Arbitration

Processes requesting access to the internal memory include the receive and transmit frame data handlers, address resolution, the VLAN lookup, learning and aging functions, egress descriptor update, and output-port queue managers. These processes are arbitrated to provide fair access to the memory and minimize the latency of critical processes to provide a fully nonblocking solution.

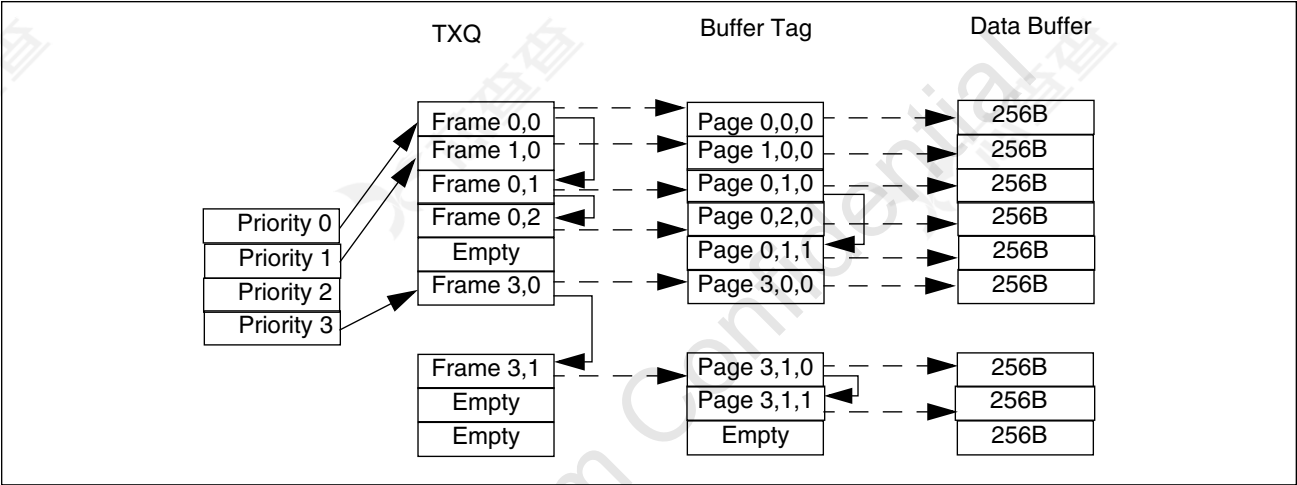

Transmit Output Port Queues

Frames are maintained in the egress port using a linked list. Two levels of linked lists are used to maintain one output queue (see the figure below). The first level is the TXQ linked list, and the second level is the buffer tag linked list. The TXQ linked list is used to maintain frame TC order for each port. For each frame, the buffer tag linked list is used to maintain the order of the buffer pages corresponding to each frame.

Each egress port supports up to six transmit queues for servicing Quality of Service (QoS). All six transmit queues share the 768 entries of the TXQ table. The TXQ table is maintained as a linked list, and each node in the TXQ uses one entry in the TXQ table. The TXQ size for each priority can be programmed to up to 768 entries.

When the QoS function has been turned off, the switch controller maintains one output queue for each egress port. The TXQ table is maintained in a per-port individual internal memory. Each node in the queue represents a pointer that points to a frame buffer tag. Each buffer tag includes frame information and a pointer to the next buffer tag. Each buffer tag has an associated page allocated in the frame buffer. For a packet with a frame size larger than 256 bytes, multiple buffer tags are required. For instance, a 9720-byte jumbo frame requires 38 buffer tags for handling the frame.

Figure 11: TXQ and Buffer Tag Structure

Section 4: System Interfaces

Overview of System Interfaces

The BCM53128 include the following interfaces:

- “Copper Interface”
- “Frame Management Port Interface” on page 93
- “Configuration Pins” on page 94
- “Programming Interfaces” on page 95
- “MDC/MDIO Interface” on page 112
- “LED Interfaces” on page 119

Each interface is discussed in detail in these sections.

Copper Interface

The internal PHYs transmit and receive data using the analog copper interface. This section discusses the following topics:

- “Auto-Negotiation” on page 92
- “Line-side (Remote) Loopback Mode” on page 93
- “Reverse MII Port (RvMII)” on page 93
- “GMII Port” on page 94
- “RGMII Port” on page 94
- “SPI-Compatible Programming Interface” on page 96
- “EEPROM Interface” on page 110
- “MDC/MDIO Interface Register Programming” on page 112
- “PseudoPHY” on page 113

Auto-Negotiation

The BCM53128 negotiate a mode of operation over the copper media using the auto-negotiation mechanism defined in the IEEE 802.3u and IEEE 802.3ab specifications. When the auto-negotiation function is enabled, the BCM53128 automatically choose the mode of operation by advertising its abilities and comparing them with those received from its link partner. The BCM53128 can be configured to advertise the following modes:

- 1000BASE-T full-duplex and/or half-duplex
- 100BASE-TX full-duplex and/or half-duplex
- 10BASE-T full-duplex and/or half-duplex

The transceiver negotiates with its link partner and chooses the highest common operating speed and duplex mode, commonly referred to as highest common denominator (HCD). Auto-negotiation can be disabled by software control, but is required for 1000BASE-T operation.

Line-side (Remote) Loopback Mode

The line-side loopback mode allows the testing of the copper interface from the link partner. This mode is enabled by setting bit 15 of the Miscellaneous Test register. The MDI receive packet is passed through the PCS and sent back out as the MDI transmit packet. The PCS receive data appears on the internal MAC interface.

Frame Management Port Interface

The dedicated frame management port provides high-speed connection to transfer management packets to an external management agent. For more information about frame management, see [“Frame Management” on page 79](#). The port is configurable to Reverse MII (RvMII), GMII, or RGMII using strap pins or software configuration.

MII Interface

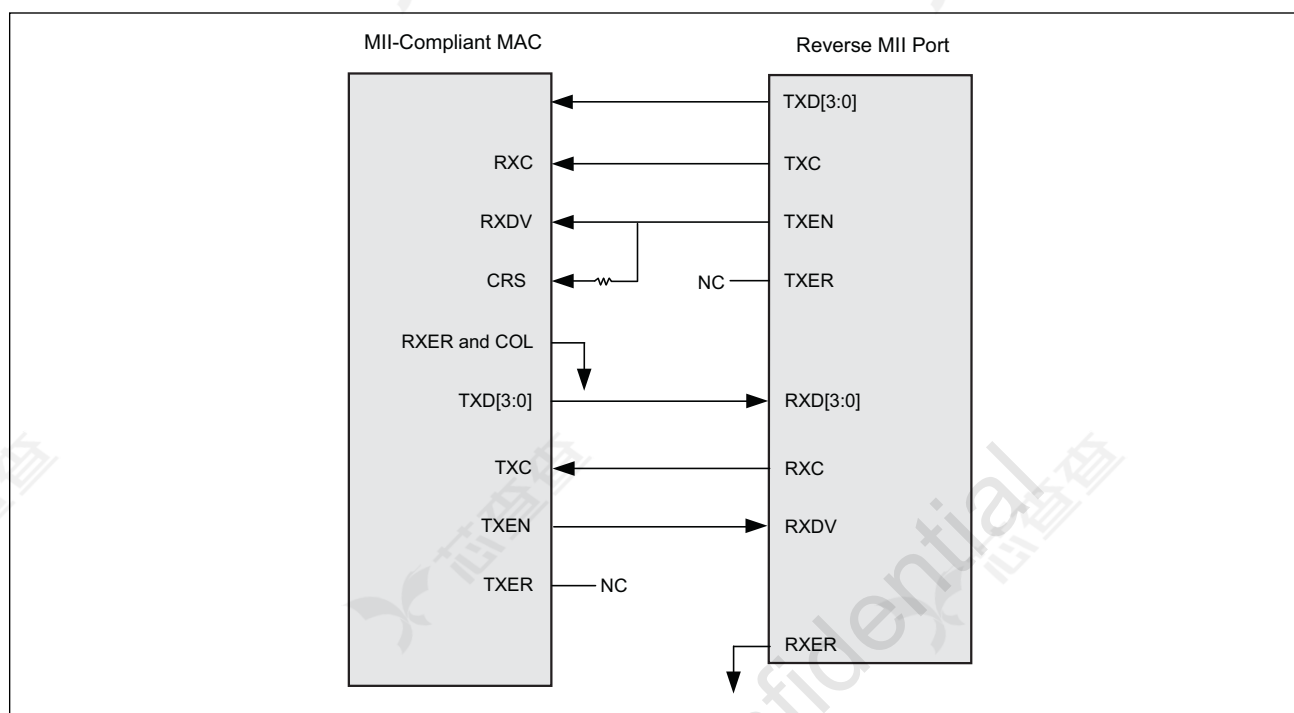

The Media Independent Interface (MII) serves as a digital data interface between the BCM53128 and an external 10/100 Mbps management entity or a PHY entity. The BCM53128 provides a fully IEEE 802.3u-compatible MII interface.

TMII (Turbo MII) and RvTMII (Reverse TMII) Interface

The TMII and RvTMII interfaces use the same hardware interface signals as the MII interface. The TMII mode requires the SPEED setting bits in the IMP Port States Override Register (Page 00h: Address 0Eh) bits[3:2] to be set. The TMII mode supports 200 Mbps data rate over the existing MII interface by running the interface at (up to) 50 MHz. The original MII timing is designed such that it can support 50 MHz clocking over the existing design.

Reverse MII Port (RvMII)

The media independent interface (MII) serves as a digital data interface between the BCM53128 and an external 10/100 Mbps management entity. Reverse MII notation reflects the MII port interfacing to a MAC-based external agent. The RvMII contains all the signals required to transmit and receive data at 100 Mbps and 10 Mbps for both full-duplex and half-duplex operation. See [Figure 12 on page 94](#) for connection information.

Figure 12: RvMII Port Connection

GMII Port

The Gigabit Media Independent Interface (GMII) serves as a digital data interface between the BCM53128 and an external gigabit management entity. Transmit and receive data is clocked on the rising edge of the clocks. The GMII transmits data synchronously using the TXD[7:0] and RXD[7:0] data signals.

RGMII Port

The Reduced Gigabit Media Independent Interface (RGMII) serves as a digital data interface between the BCM53128 and an external gigabit management entity. Transmit and receive data is clocked on the rising and falling edge of the clocks. This reduces the number of data signals crossing the MAC interface without affecting the data transmission rate. The RGMII transmits data synchronously using the TXD[3:0] and RXD[3:0] data signals.

Configuration Pins

Initial configuration of the BCM53128 takes place during power-on/reset by loading internal control values from hardware strap pins. The value of the pin is loaded when the reset sequence completes, and the pin transitions to normal operation. Pull-up or pull-down resistors can be added to these pins to control the device configuration. If the pins are left floating, the default value is determined based on the internal pull-up or pull-down configuration. See [“Signal Descriptions” on page 125](#) for more information.

Programming Interfaces

The BCM53128 can be programmed using the SPI interface or the EEPROM interface. The interfaces share a common pin set that is configured using the CPU_EPROM_SEL strap pin. The “[SPI-Compatible Programming Interface](#)” provides access for a general-purpose microcontroller, allowing read and write access to the internal BCM53128 register space. It is configured to be compatible with the Motorola Serial Peripheral Interface (SPI) protocol. Alternatively, the “[EEPROM Interface](#)” on page 110 can be connected to an external EEPROM for writing register values upon power-up initialization.

The internal address space of the BCM53128 devices is broken into a number of pages. Each page groups a logical set of registers associated with a specific function. Each page provides a logical address space of 256 bytes, although, in general, only a small portion of the address space in each page is utilized.

An explanation follows for using the serial interface with an SPI-compatible CPU (“[SPI-Compatible Programming Interface](#)” on page 96) or an EEPROM (“[EEPROM Interface](#)” on page 110). Either mode can be selected with the strap pin, CPU_EPROM_SEL. Either mode has access to the same register space.

Serial Flash Interface

The BCM53128 offers a serial flash interface to store program code for the internal microcontroller (8051 processor). The BCM53128 detects a flash memory device automatically and downloads the memory contents upon power-up. The main purpose of the stored code is to configure and run the power savings mode, such as Green mode or any application that the user wishes to run that can fit in the internal 8051 memory. The embedded 8051 microcontroller has 128 KB of SRAM and 64 KB of ROM, supports receiving and transmitting packets, and supports interleaved ROM/RAM access. The interface comprises four signal pins: chip select (FCS), Flash clock (FCLK), Flash Serial Out (FSO), and Flash Serial In (FSI).

GPIO

BCM53128 supports up to 8 GPIO pins. These GPIO pins can be used to connect to various external devices. Upon power-up and reset, these pins become tristated. Enable GPIO pins through the GPIO Enable Register in 8051 Memory-Mapped Registers. They can be programmed to be either input or output pins via the GPIO registers in 8051 Memory-Mapped Registers. The internal pull-up/pull-down of GPIOs is user-configurable through GPIO registers setting in 8051 Memory-Mapped Registers. Refer to the *BCM53128 Programmer's Reference Guide* (document number 53128-PG1xx-R) for 8051 Memory-Mapped Registers detail information.

SPI-Compatible Programming Interface

One way to access the BCM53128 internal registers is to use the serial peripheral interconnect (SPI) compatible interface. This four-pin interface is designed to support a fully functional, bi-directional Motorola serial peripheral interface (SPI) for register read/write accesses. The maximum speed of operation is 25 MHz. The SPI interface shares pins with the EEPROM interface. To select the SPI interface, pull up or float the CPU_EPROM_SEL pin. (The internal pull-up resistor defaults SPI interface over EEPROM interface.)

The SPI is a four-pin interface consisting of:

- Device select (\overline{SS} : slave select, input to BCM53128)
- Device clock (SCK: which operates at speeds up to 25 MHz, input to BCM53128)
- Data write line (MOSI: Master Out/Slave In, input to BCM53128)
- Data read line (MISO: Master In/Slave Out, output from BCM53128)

Note: All the RoboSwitch™ SPI interfaces are designed to operate in slave mode. Therefore, the SCK and SS signals are driven by the external master host device when accessing the BCM53128 registers. For more detailed descriptions reader may refer to the *Motorola SPI spec MC68HC08AS20-Rev. 4.0*.

\overline{SS} : Slave Select

The \overline{SS} signal is used to select a slave device and to indicate the beginning of transmission. The BCM53128 SPI interface operates in the clock phase one (CPHA = 1) transmission format. In this format, the SS signal is driven active low while the SCK signal is high, and remains low throughout the transmission including multiple-byte transfers. The minimum time requirement between \overline{SS} operation is 200 ns.

SCK: Serial Clock

The serial clock SCK maximum operating frequency is 25 MHz for the BCM53128 family of devices. The SCK is used to clock data into and out of the Slave ROBO device. The SCK signal is expected to remain high when the interface is idle. This is because the BCM53128 SPI design is based on CPOL = 1 (Clock Polarity = 1). This is not programmable on BCM53128. The BCM53128 is designed so that data is driving by the falling edge and sampling by the rising edge of the SCK clock. This clock is not a free-running clock, it is generated only during a data transaction, and remains high when the clock is idle.

MOSI: Master Output Slave Input

The MOSI signal is used by the master device to transmit the data to the slave device. The data is put on the bus and is expected to be clocked in by a rising edge of the SCK clock signal. This line is used to issue a command and to set the register page and address value of read/write operations.

MISO: Master Input Slave Output

The MISO signal is used by the Slave device to output the data to the master device. The data is put on the bus and is expected to be clocked out by a rising edge of the SCK clock signal. This line is used to transmit the status and the content of the register of read operation.

A layer of protocol is added to the basic SPI definition to facilitate transfers from the BCM53128. This protocol establishes the definition of the first 2 bytes issued by the master to the BCM53128 slave during an SPI transfer. The first byte issued from the SPI master in any transaction is defined as a command byte, which is always followed by a register address byte, and any additional bytes are data bytes.

The SPI mode supports two different access mechanisms, normal SPI and fast SPI, determined by the content of the command byte. Figure 13 shows the normal SPI command byte, and Figure 14 on page 97 shows the Fast SPI command byte. These two mechanisms should not be mixed in an implementation; the CPU should always initiate transfers consistently with only one of the two mechanisms.

Figure 13: Normal SPI Command Byte

0	1	1	MODE = 0	CHIP ID 2 (MSB)	CHIP ID 1	CHIP ID 0 (LSB)	Read/Write (0/1)
---	---	---	----------	--------------------	-----------	--------------------	---------------------

Figure 14: Fast SPI Command Byte

Byte Offset (MSB)	Byte Offset	Byte Offset (LSB)	MODE = 1	CHIP ID 2 (MSB)	CHIP ID 1	CHIP ID 0 (LSB)	Read/Write (0/1)
----------------------	-------------	----------------------	----------	--------------------	-----------	--------------------	---------------------

The MODE bit (bit 4) of the command byte determines the meaning of bits 7:5. If bit 4 is a 0, it is a normal SPI command byte, and bits 7:5 should be defined as 011b. If bit 4 is a 1, bits 7:5 indicate a fast SPI command byte, and bits 7:5 indicate the byte offset into the register that the BCM53128 starts to read from (byte offsets are not supported for write operations).

In command bytes, bits[3:1] indicate the CHIP ID to be accessed. Because the BCM53128 operates as a single-chip system, the CHIP ID is 000.

Note: The \overline{SS} signal must also be active for any BCM53128 device to recognize that it is being accessed.

Bit 0 of the command byte is the R/W signal (0 = Read, 1 = Write) and determines the transmission direction of the data.

The byte following the command byte is an 8-bit register address. Initially, this sets the page address, followed by another command byte that contains the register base address in that page, which is used as the location to store the next byte of data received in the case of a write operation, or the next address from which to retrieve data in the case of a read operation. This base address increments as each byte of data is transmitted/received, allowing a contiguous block data from a register to be stored/read in a single transmission. When the fast SPI command byte mode is used, the actual start location of a read operation can be modified by the offset contained in bits 7:5 of the command byte. Reading/writing data from/to separate registers, even if those registers are contiguous in the current page, must be performed by supplying a new command byte and register address for each register, with the address as defined in the appropriate page register map.

Noncontiguous blocks are also stored/read through the use of multiple transmissions, which allow a new command byte and register base address to be specified. The \overline{SS} signal must remain low for the entire read or write transaction, as shown in the following figures, with the transaction terminated by the deassertion of the \overline{SS} line by the master.

Figure 15: SPI Serial Interface Write Operation

Figure 16: SPI Serial Interface Read Operation

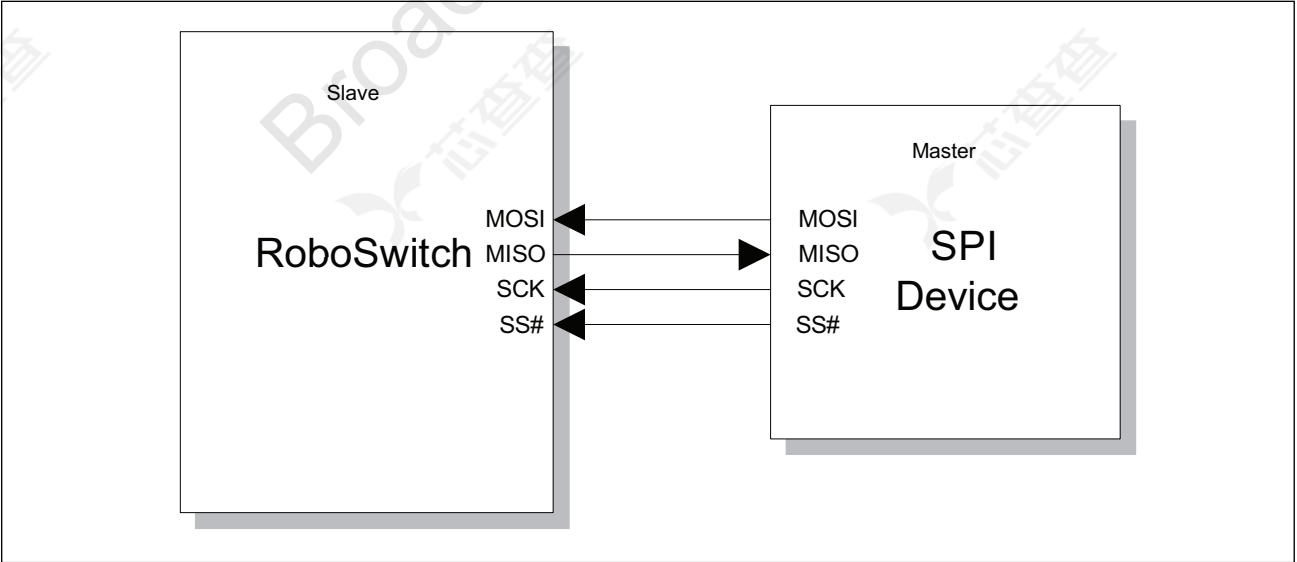

Figure 17 and Figure 18 on page 99 show the typical connection block diagram for SPI interface with/without external PHY devices.

Without External PHY

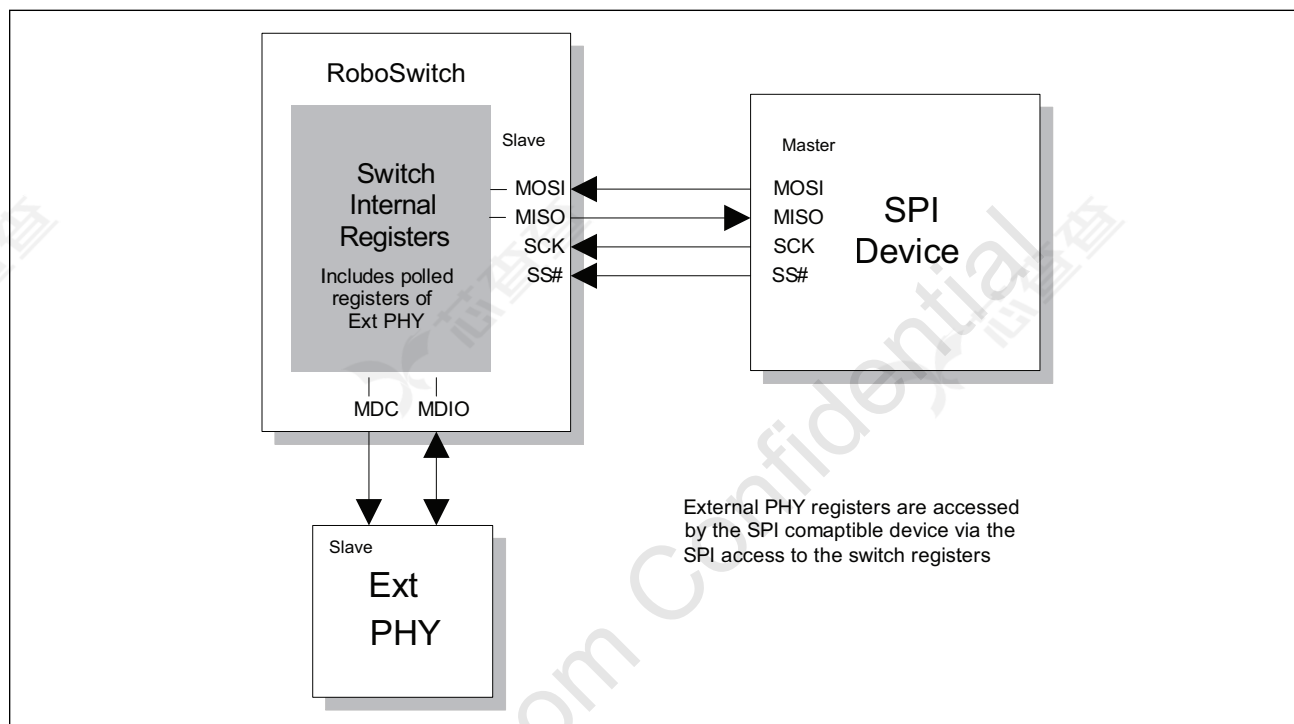

Figure 17: SPI Interface Without External PHY Device

External PHY Registers

The BCM53128 also uses the MDIO/MDC interface for polling registers of an external PHY. In this case, the MDIO/MDC interface polls the external PHY registers pulling the data internal to the BCM53128. Then, the external PHYs and retrieved from the register data using the SPI interface. The MDIO/MDC interface is not used as a method to access internal PHY registers. This must be done using the SPI interface.

Figure 18: Accessing External PHY Registers

Reading and Writing BCM53128 Registers Using SPI

BCM53128 internal register read and write operations are executed by issuing a command followed by multiple accesses of the SPI registers in the BCM53128. There are three SPI interface registers in the BCM53128 that are used by the master device to access the internal switch registers. The SPI interface registers are:

- SPI Page register (page: global, address: FFh): used to specify the value of the specific register pages.
- SPI Data I/O register (page: global, address: F0h): used to write and read the specific register's content.
- SPI Status Register (page: global, address: FEh): used to check for an operation completion.
 - Bit 7: SPIF, SPI read/write complete flag
 - Bit 6: Reserved
 - Bit 5: RACK, SPI read data ready acknowledgement
 - Bit 4:3: Reserved
 - Bit 2: MDIO_Start, Start/Done MDC/MDIO operation
 - Bit 1: Reserved
 - Bit 0: Reserved

The BCM53128 SPI interface supports the following operating modes.

- Normal read mode
- Fast read mode
- Normal write mode

Note: The RoboSwitch family does not support fast-write mode.

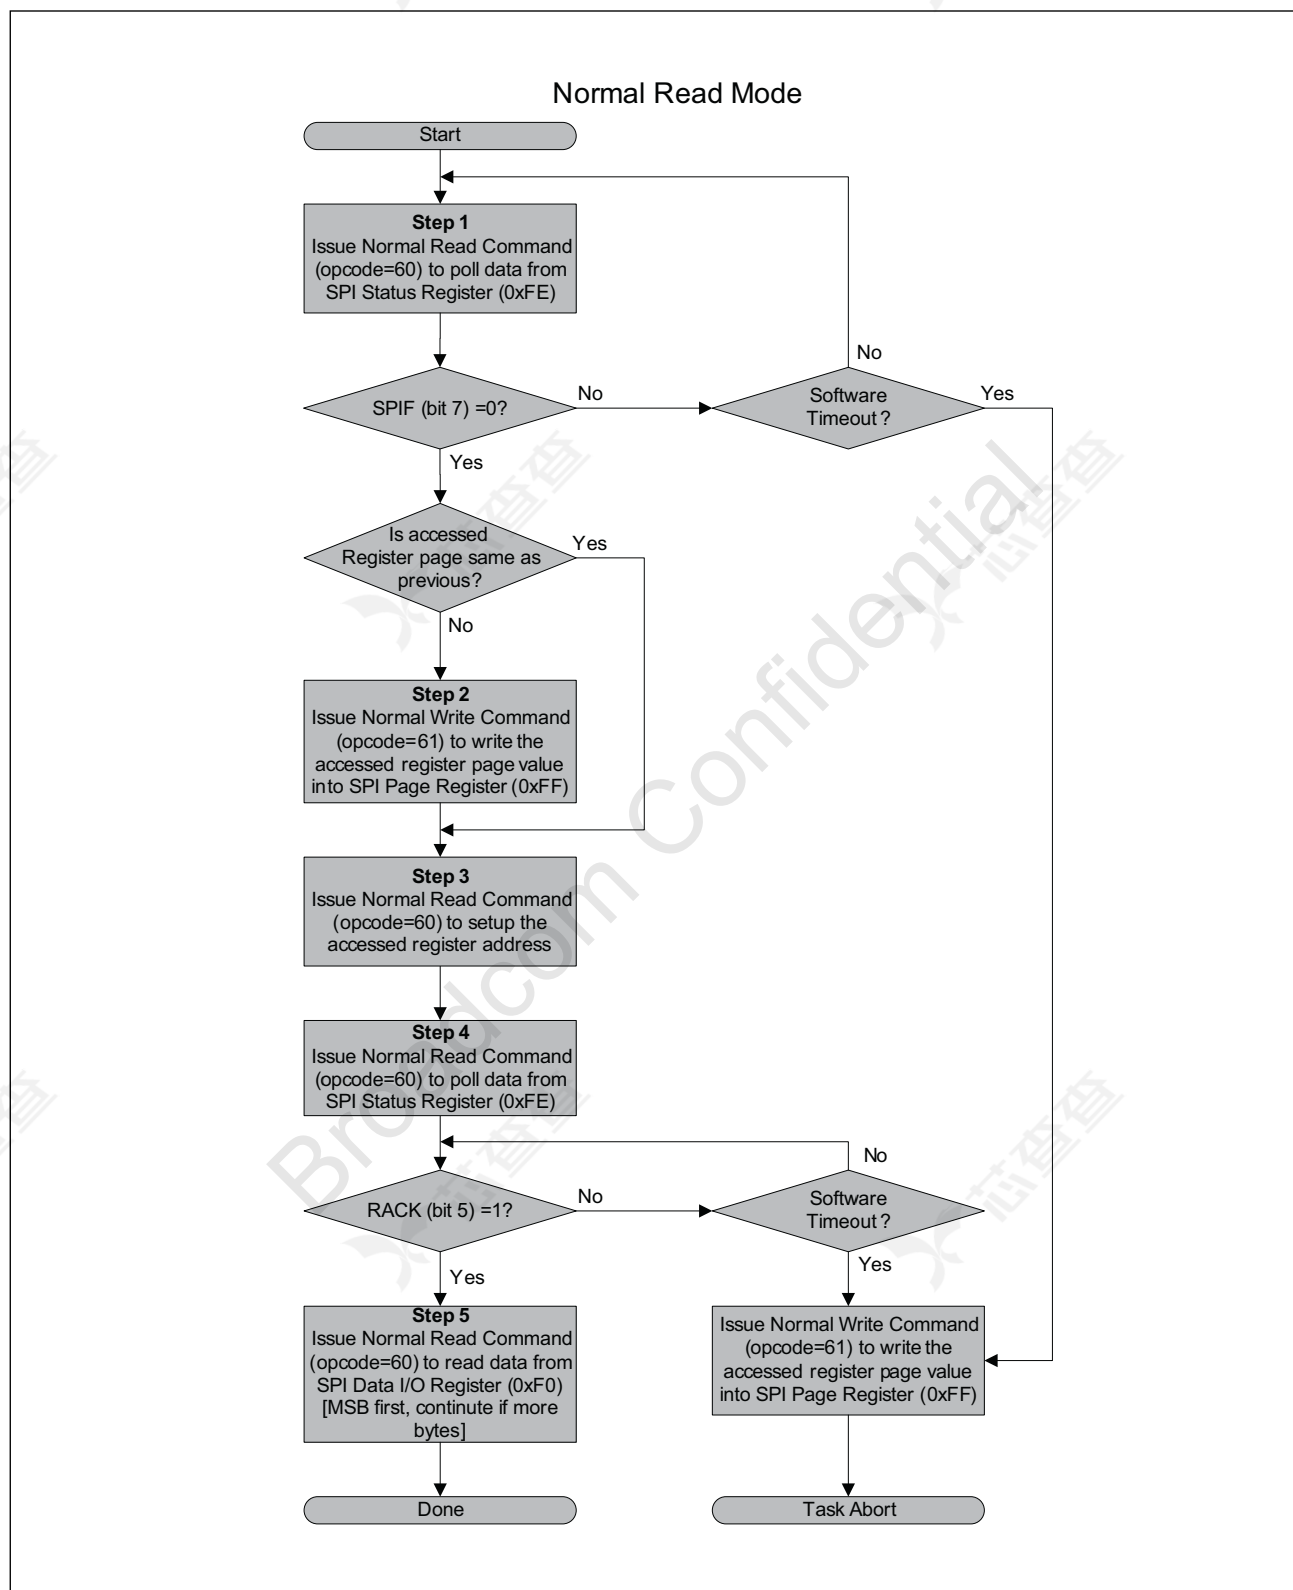

The details of each modes are described in the following paragraphs.

Normal Read Operation

Normal Read operation consists of five transactions (five \overline{SS} operations):

1. Issue a Normal Read Command (opcode = 0x60) to poll the SPIF bit in the SPI Status register (0xFE) to determine the operation can start.
2. Issue a Normal Write command (opcode = 0x61) to write the register page value into the SPI Page register 0xFF.
3. Issue a Normal Read command (opcode = 0x60) to setup the required RoboSwitch register address.
4. Issue a Normal Read command (opcode = 0x60) to poll the RACK bit in the SPI status register(0xFE) to determine the completion of read (register content gets loaded in SPI Data I/O register).
5. Issue a Normal Read command (opcode = 0x60) to read the specific registers' content placed in the SPI Data I/O register (0xF0).

Figure 19: Normal Read Operation

Example: Read from 1000BASE-T Control register (Page 10h, Offset 12h).

1. Issue a Normal Read command (opcode = 0x60) to check the SPIF bit in the SPI Status register (0xFE).
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Normal Read Command Byte: 0 1 1 0 0 0 0 (opcode = 0x60)
 - Clock in the SPI Status register address (0xFE)
 - Clock out the SPI Status register value: 0 0 0 0 0 0 0 (SPIF bit 7=0)
 - Deassert \overline{SS} while SCK is high idle state

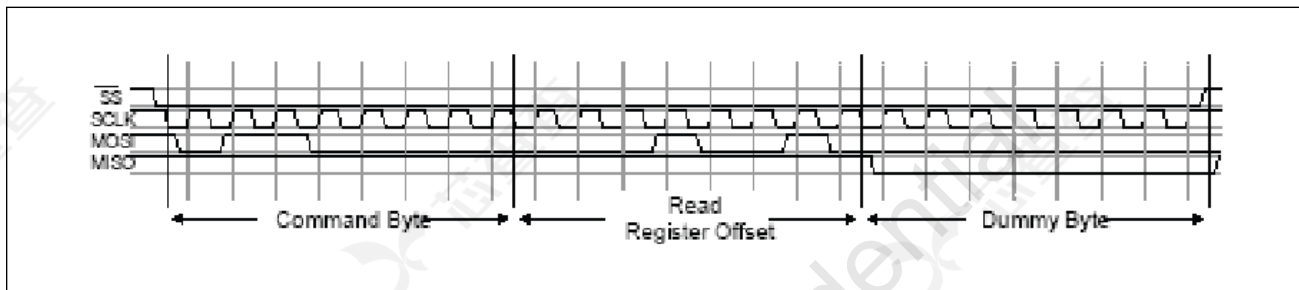

Figure 20: Normal Read Mode to Check the SPIF Bit of SPI Status Register

2. Issue a Normal Write command (opcode = 0x61) and write the accessed register page value of 0x10 into SPI Page Register(0xFF)—this step is required only if previous read/write was not to/from Page 10h.
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Normal Write Command Byte: 0 1 1 0 0 0 0 1 (opcode = 0x61)
 - Clock in offset of Page register (0xFF)
 - Clock in the accessed register page value, 0 0 0 1 0 0 0 0 (Page register: 0x10)
 - Deassert \overline{SS} while SCK is high idle state

Figure 21: Normal Read Mode to Setup the Accessed Register Page Value

3. Issue a Normal Read command (opcode = 0x60) and write the accessed register address value 0x12, and clock out 8 bits to complete the read cycle, but discard result (this is where the state machine triggers a internal data transfer from Address 0x12 to the SPI Data I/O register)
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Normal Read Command Byte: 0 1 1 0 0 0 0 0 (opcode = 0x60)
 - Clock in the address of accessed register address value (0x12)
 - Clock out eight clocks for the dummy read, and discard results on MISO
 - Deassert \overline{SS} while SCK is high idle state

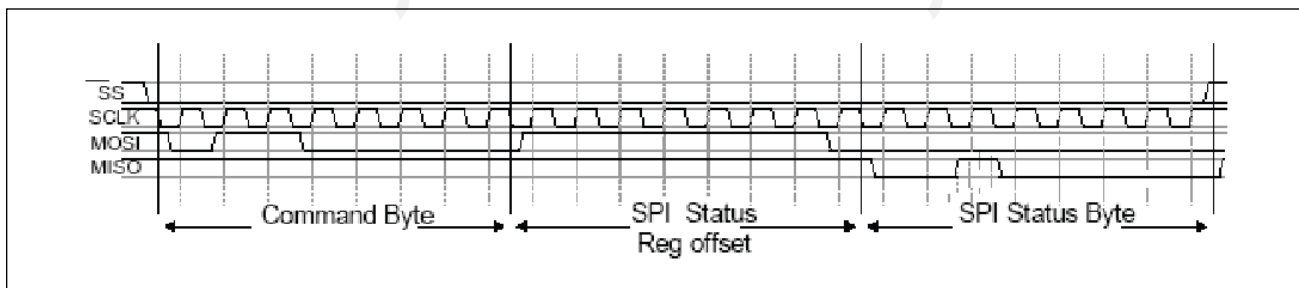

Figure 22: Normal Read Mode to Setup the Accessed Register Address Value (Dummy Read)

Note: This dummy read is always eight clock cycles, whether or not it is an 8-bit register.

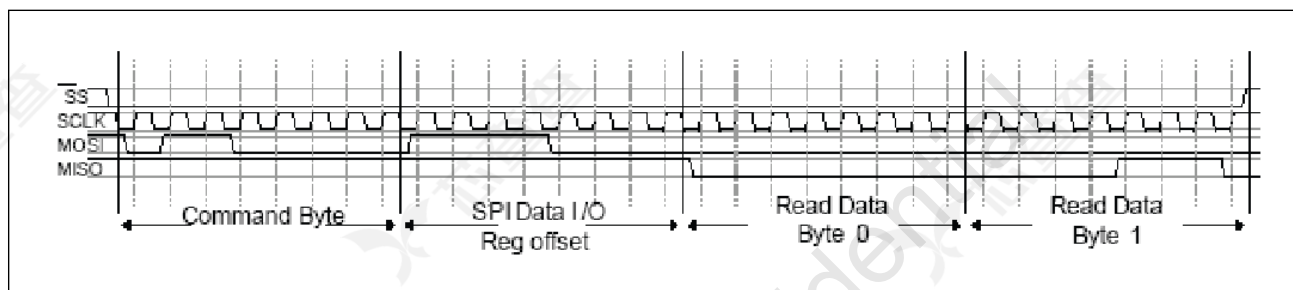

4. Issue a Normal Read command (opcode = 0x60) to read the SPI Status to check the RACK bit for completion of the register content transfer to the SPI Data I/O register. (this step may be repeated until the proper bit set is read.)
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Normal Read Command Byte: 0 1 1 0 0 0 0 0 (opcode = 0x60)
 - Clock in offset for SPI Status Register (0xFE): 1 1 1 1 1 1 1 0
 - Clock out the content of SPI Status bits
 - Repeat the polling until the content of SPI Status Register value: 0 0 1 0 0 0 0 0 (RACK bit 5= 1)
 - Deassert \overline{SS} while SCK is high idle state

Figure 23: Normal Read Mode to Check the SPI Status for Completion of Read

5. Issue a Normal Read command (opcode = 0x60) to read the data from the SPI Data I/O register:
 - Assert \overline{SS} while SCK is high idle state
 - Clock in Command Byte: 0 1 1 0 0 0 0 (opcode = 0x60)
 - Clock in offset of SPI Data I/O Register (0xF0)
 - Clock out first data byte on MISO line: 0 0 0 0 0 0 0 0 (Byte 0: Bit 7 to Bit 0: MSB to LSB)
 - Clock out next byte (in this case, last) on MISO line: 0 0 0 0 1 1 1 0 (Byte 1: Bit 15 to Bit 8)
 - [Continue if more bytes]
 - Deassert \overline{SS} while SCK is high idle state

Figure 24: Normal Read Mode to Obtain the Register Content

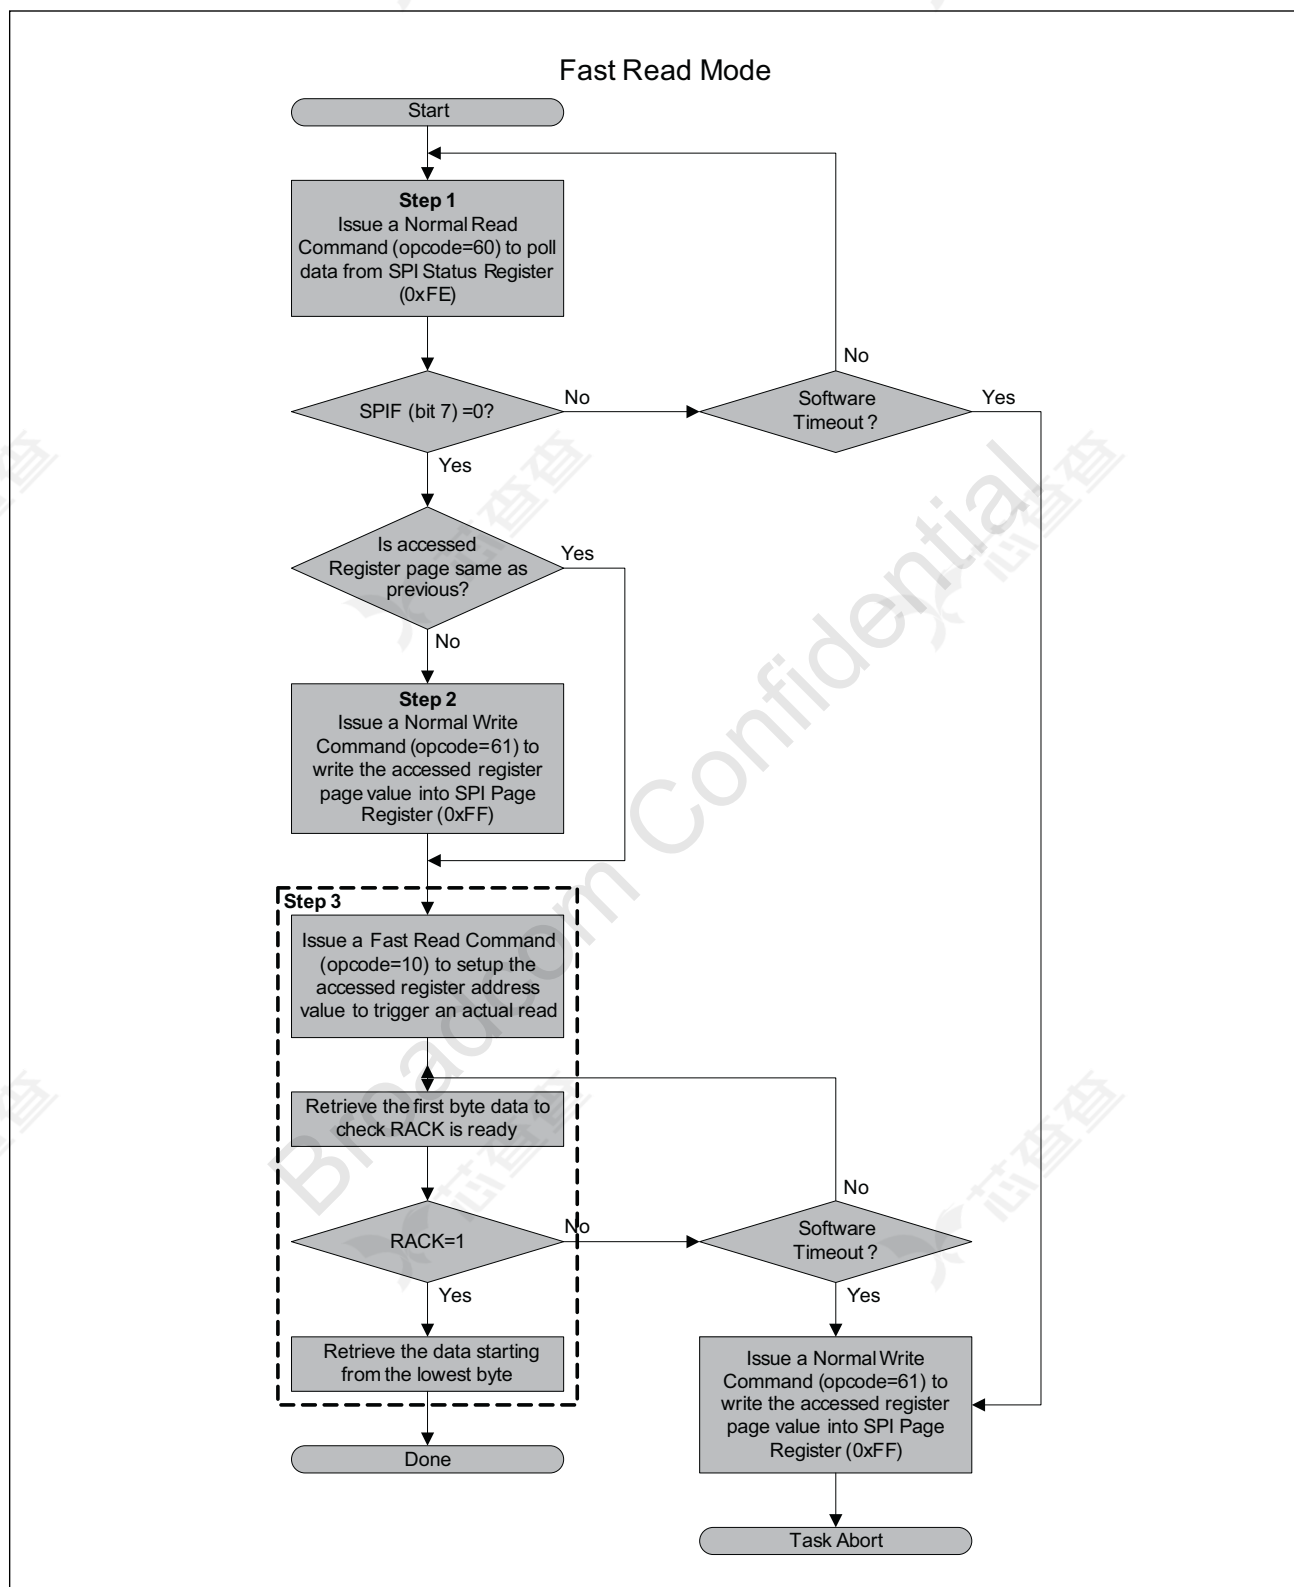

Fast Read Operation

Fast Read operation consists of 3 transactions (three \overline{SS} operations)

1. Issue a Normal Read Command (opcode = 0x60) to poll the SPIF bit in the SPI Status Register (0xFE) to determine the operation can start.
2. Issue a Fast Read command (opcode = 0x10) to setup the accessed Register Page value into the Page register (0xFF).
3. Issue a Fast Read command (opcode = 0x10) to setup the accessed register address value, to trigger an actual read, and retrieve the accessed register content till the completion

Fast Read mode process is different from Normal Read mode, once the switch receives a fast read command followed by the register page and address information, the status and the data (register content) will be put on the MISO line without going through the SPI Status register or SPI Data I/O register. Once RACK bit of the bytes following the Fast Read command with Address information is recognized the register content will be put on MISO line immediately following the byte with RACK bit set. The Fast Read process is described in the following paragraphs with a flowchart followed by a step by step description.

Figure 25: Fast Read Operation

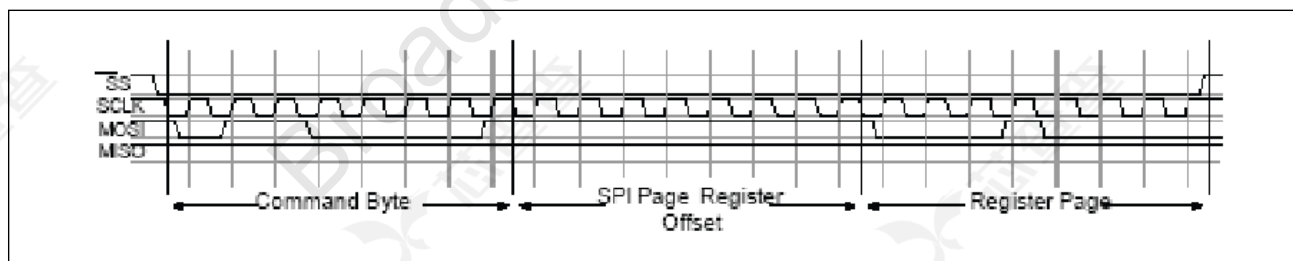

Example: Read from 1000BASE-T Control register (Page 10h, Offset 12h).

1. Issue a Normal Read command (opcode = 0x60) to check the SPIF bit in the SPI Status register (0xFE).
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Normal Read Command Byte: 0 1 1 0 0 0 0 (opcode = 0x60)
 - Clock in the SPI Status register address (0xFE)
 - Clock in the accessed register page value: 0 0 0 0 0 0 0 (SPIF bit 7=0)
 - Deassert \overline{SS} while SCK is high idle state

Figure 26: Normal Read Mode to Check the SPIF Bit of SPI Status Register

2. Issue a Normal Write command (opcode = 0x61) and write the accessed register page value of 0x10 in to SPI Page Register(0xFF) —this step is required only if previous read/write was not to/from Page 10h.
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Fast Read Command Byte: 0 11 0 0 0 0 1 (opcode = 0x61)
 - Clock in offset of Page register (0xFF)
 - Clock in the accessed register page value: 0 0 0 1 0 0 0 (Page register: 0x10)
 - Deassert \overline{SS} while SCK is high idle state

Figure 27: Fast Read Mode to Setup New Page Value

3. Issue a Fast Read command (opcode = 0x10), followed by the Address of the accessed register (0x12), check for a read completion by checking the RACK bit in the SPI Status register, and finally clock out the read data.
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Fast Read Command Byte: 0 0 0 1 0 0 0 0 (opcode = 0x10)
 - Clock in the Address of accessed register (0x12)
 - Clock out Bytes Until Bit 0 or Bit 1 = 1 : 0 0 0 0 0 0 0 1 (RACK bit 0=1)
 - Clock out first data byte: 0 0 0 0 0 0 0 0 (Byte 0: Bit 7 to Bit 0)
 - Clock out next data (in this case, last) byte: 0 0 0 0 1 1 1 0 (Byte 1: Bit 15 to Bit 8)
 - [Continue if more bytes]
 - Deassert \overline{SS} while SCK is high idle state

Figure 28: Fast Read to Read the Register

Note: There is an errata on the RACK output timing in Fast Read mode. The RACK (bit 0) must be sampled prior to toggling the clock to shift out the bit 0.

Normal Write Operation

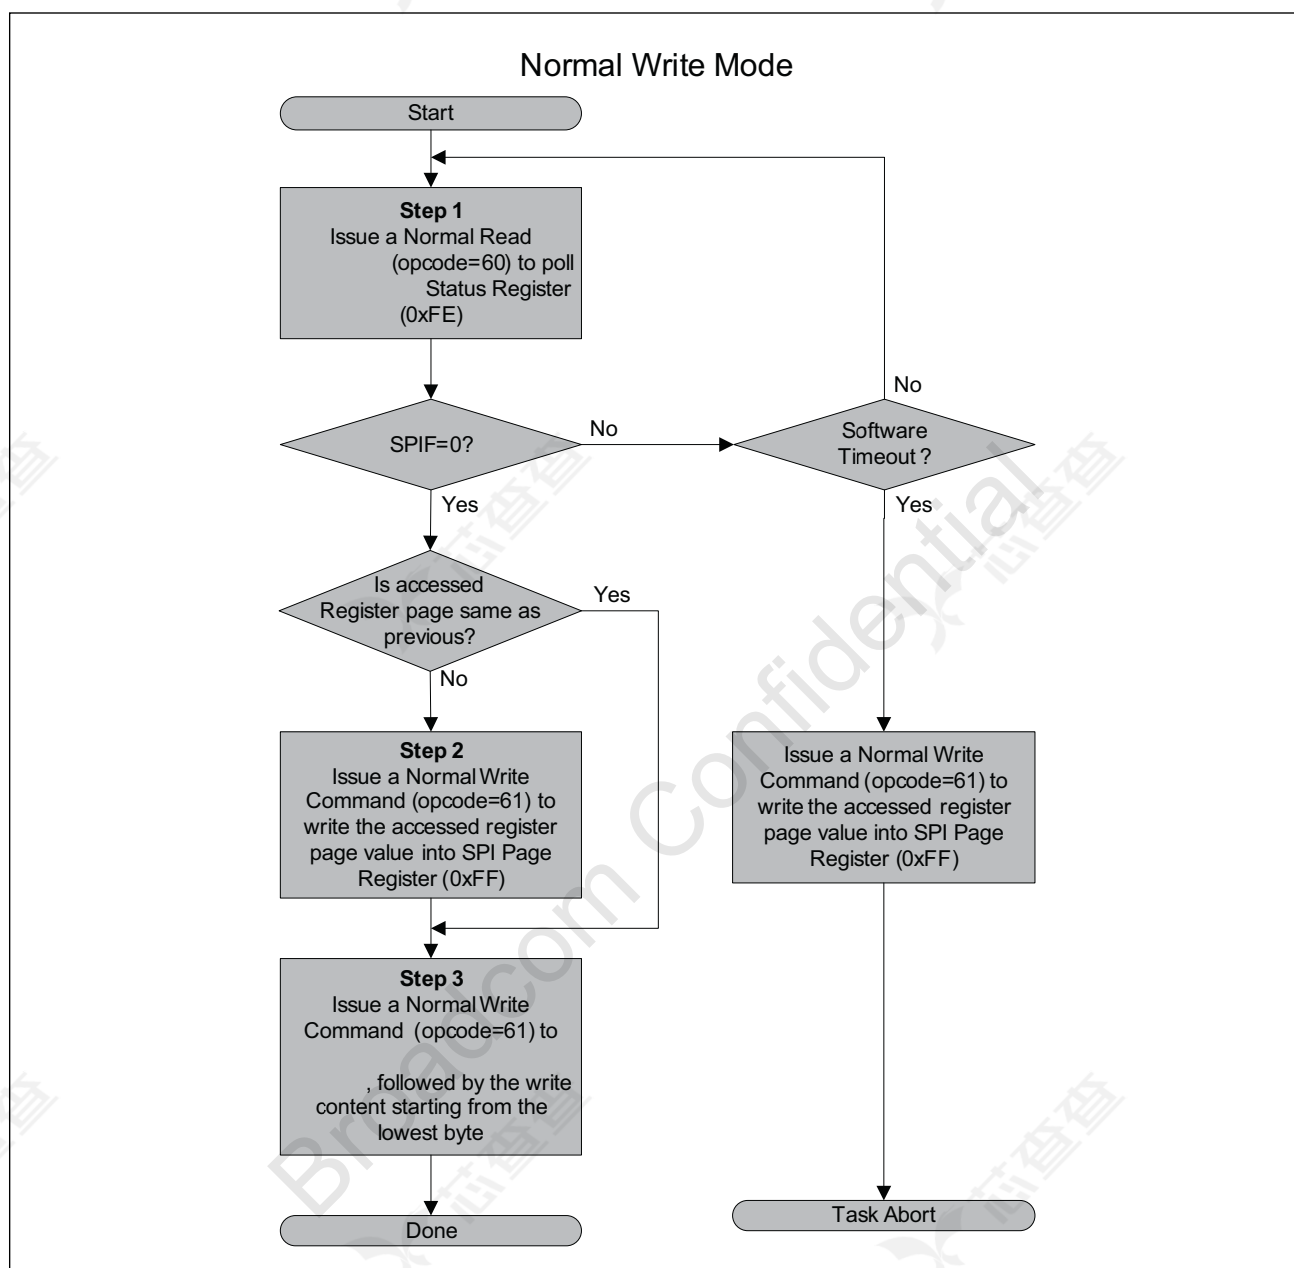

Normal Write operation consists of 3 transactions (three \overline{SS} operations)

1. Issue a Normal Read Command (opcode = 0x60) to poll the SPIF bit in the SPI Status register (0xFE) to determine the operation can start.
2. Issue a Normal Write command (opcode = 0x61) to setup the accessed register page value into the page register (0xFF).
3. Issue a Normal Write command (opcode = 0x61) to setup the accessed register address value, followed by the write content starting from a lower byte.

The Normal Write Mode process is described in the following paragraphs with a flowchart followed by a step by step description.

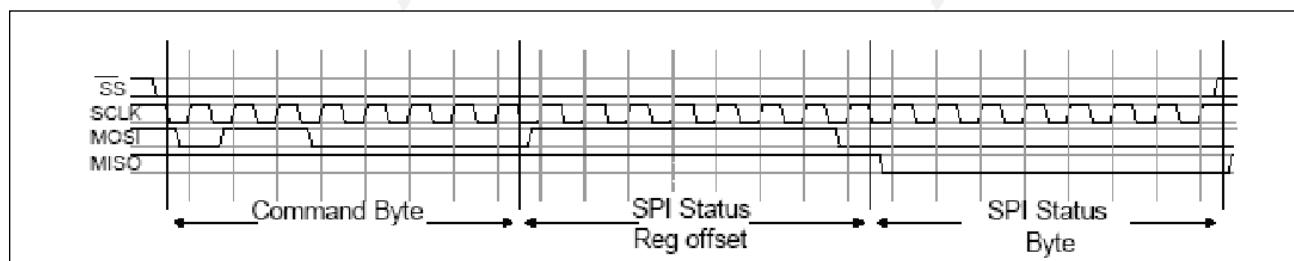

Note: The RoboSwitch does not support Fast Write Mode.

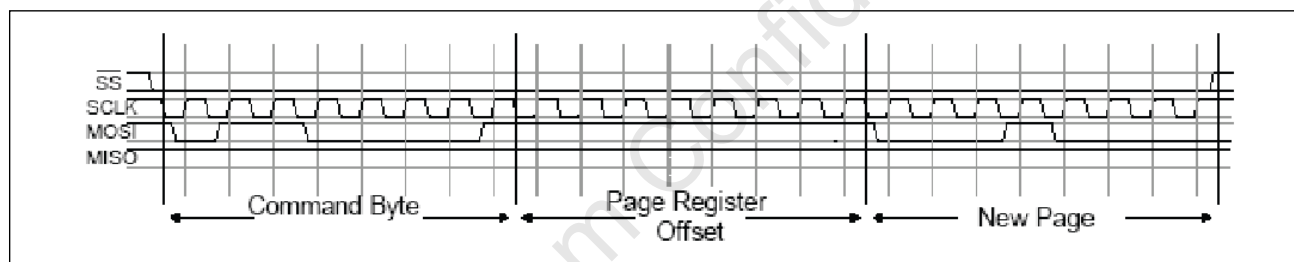

Figure 29: Normal Write Operation

Example: 0x1600h is written to 1000BASE-T Control Register (Page 0x10, Offset 0x12).

1. Issue a Normal Read command (opcode = 0x60) to check the SPIF bit in the SPI Status register (0xFE).
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Normal Read Command Byte: 0 1 1 0 0 0 0 0 (opcode = 0x60)
 - Clock in the SPI Status register address (0xFE)
 - Clock in the accessed register page value, : 0 0 0 0 0 0 0 0 (SPIF bit 7=0)
 - Deassert \overline{SS} while SCK is high idle state

Figure 30: Normal Read Mode to Check the SPIF Bit of SPI Status Register

2. Issue a Normal Write command (opcode = 0x61) and write the accessed register page value of 0x10 into SPI Page register (0xFF)—this step is required only if previous read/write was not from/to Page 0x10.
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Normal Write Command Byte: 0 1 1 0 0 0 0 1 (opcode = 0x61)
 - Clock in offset of Page register (0xFF)
 - Clock in 1 byte of the accessed register page value (Page register 0x10)
 - Deassert \overline{SS} while SCK is high idle state

Figure 31: Normal Write to Setup the Register Page Value

3. Issue a Normal Write command (opcode = 0x61) and write the Address of the accessed register followed by the write content starting from a lower byte.
 - Assert \overline{SS} while SCK is high idle state
 - Clock in a Normal Write Command Byte: 0 1 1 0 0 0 0 1 (opcode = 0x61)
 - Clock in Offset of Address of accessed register (0x12)
 - Clock in lower data byte first: 0 0 0 0 0 0 0 0 (Byte 0: Bit 7 to Bit 0)
 - Clock in upper data byte next: 0 0 0 1 0 1 1 0 (Byte 1: Bit 15 to Bit 8)
 - [Continue if more bytes]
 - Deassert \overline{SS} while SCK is high idle state

Figure 32: Normal Write to Write the Register Address Followed by Written Data

EEPROM Interface

The BCM53128 can be connected using the serial interface to a low-cost external serial EEPROM, enabling it to download register-programming instructions during power-on initialization. For each programming instruction fetched from the EEPROM, the instruction executes immediately and affects the register file.

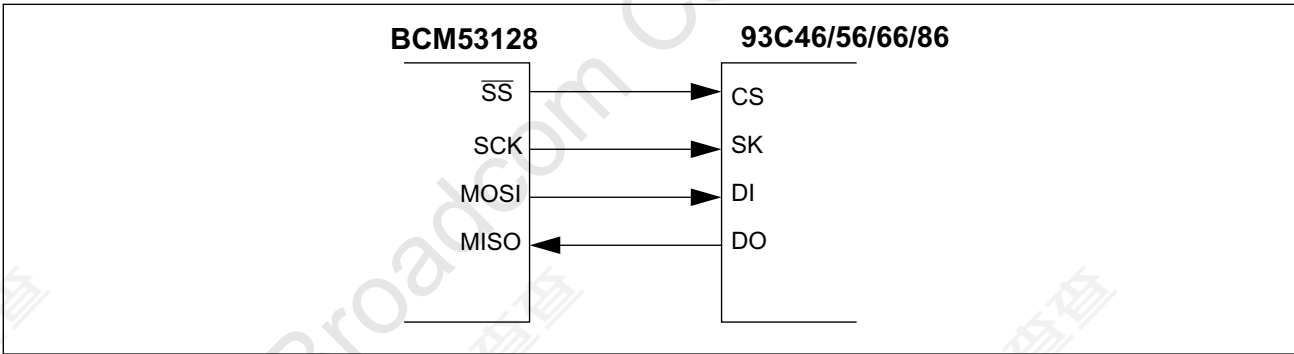

During the chip-initialization phase, the data is sequentially read-in from the EEPROM after the internal memory has been cleared. The first data read-in is the HEADER and it matches a predefined magic code. In the case where the HEADER data does not match the instruction fetch, the process stops, and the EEPROM controller treats it as if no EEPROM exists. If the magic code matches, the fetch instruction process continues until it reaches the instruction length defined in the HEADER.

Due to the different access cycles of different capacity EEPROMs, the strap pins EEPROM_TYPE[1:0] are used to support the various EEPROM devices according to Table 26.

Table 26: EEPROM_TYPE[1:0] Settings

EEPROM_TYPE[1:0]	EEPROM
00	93C46
01	93C56
10	93C66
11	93C86

Figure 33: Serial EEPROM Connection

EEPROM Format

The EEPROM should be configured to x16 word format. The header contains key and length information as shown in Table 27. The actual data stored in the EEPROM is byte-swapped as shown in Table 28.

- Upper 5 bits are magic code 15h, which indicates that valid data follows.
- Bit 10 is for speed indication. A 0 means normal speed. A 1 indicates speedup. The default is 0.
- Lower 10 bits indicate the total length of all entries. For example:
 - 93C46 up to 64 words
 - 93C56 up to 128 words
 - 93C66 up to 256 words
 - 93C86 up to 1024 words

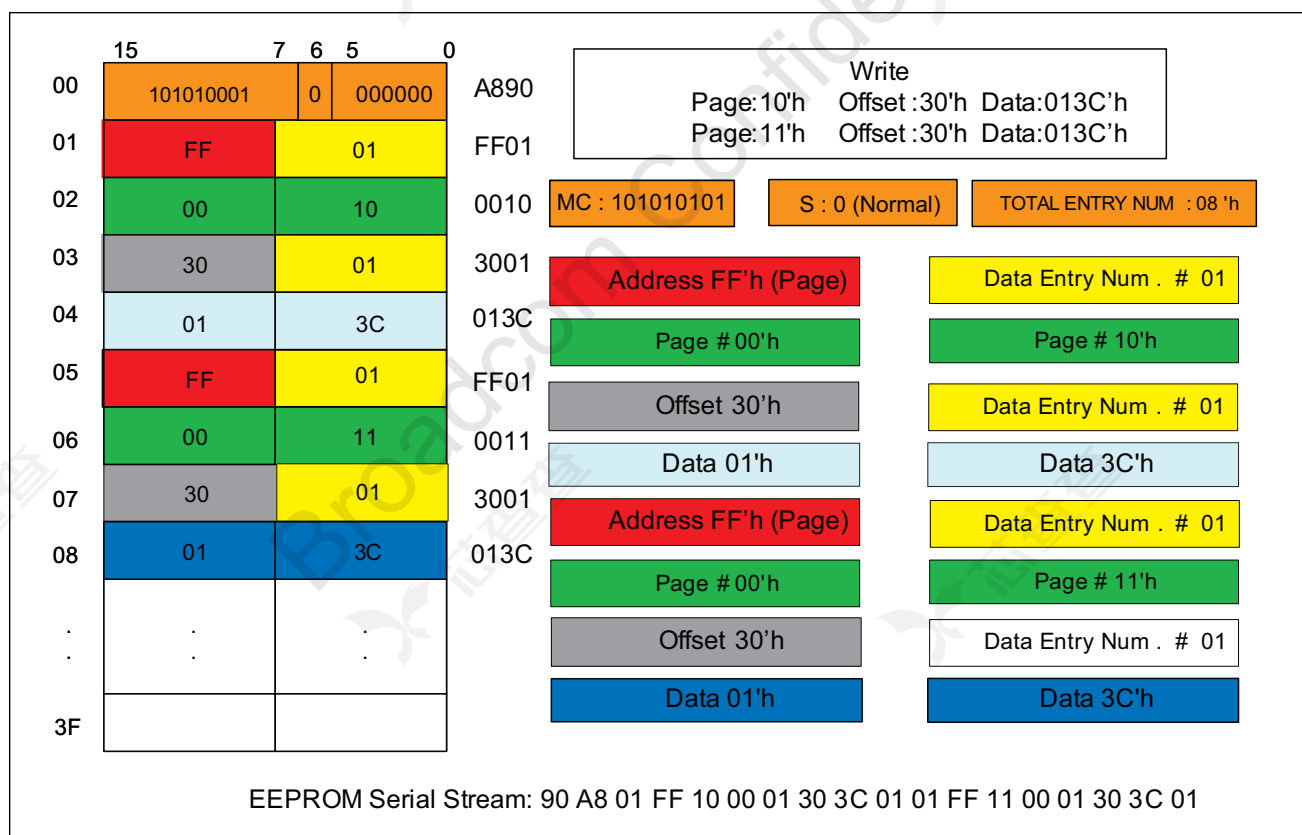

Table 27: EEPROM Header Format

Bits [15:11]	Bit 10	Bits [9:0]
Magic code, 15h	Speed	Total entry number 93C46: 0 ~ 63 93C56: 0 ~ 127 93C66: 0 ~ 255 93C86: 0 ~ 1023

Table 28: EEPROM Contents

Bits [7:0]	Bits [15:11]	Bit 10	Bits [9:8]
Total entry number	Magic code, 15h	Speed	Total entry number

Figure 34 shows an EEPROM programming example.

Figure 34: EEPROM Programming Example

MDC/MDIO Interface

BCM53128 offers an MDC/MDIO interface for accessing the switch registers as well as the PHY registers. An external management entity can access the switch registers through this interface when the SPI interface is not used. (i.e., when the SPI clock is in idle mode.) The switch registers are accessed through the Pseudo PHY interface, and the PHY registers are accessed directly by using PHY addresses.

External PHY can be connected to GMII interface of IMP port. Through the SPI interface, by accessing the Page 88h, the external PHY MII registers can be accessed. The actual PHY address can be assigned through the MDIO IMP Port Address register.

Note: The PHY registers are not accessible through the Pseudo PHY operation.

MDC/MDIO Interface Register Programming

The BCM53128 are designed to be fully compliant with the MII clause of the IEEE 802.3u Ethernet specification. The MDC pin of the BCM53128 sources a 2.5-MHz clock. Serial bidirectional data transmitted using the MDIO pin is synchronized with the MDC clock. Each MII read or write instruction is initiated by the BCM53128 and contains the following:

- **Preamble (PRE).** To signal the beginning of an MII instruction after reset, at least 32 consecutive 1-bits must be written to the MDIO pin. A preamble of 32 1-bits is required only for the first read or write following reset. A preamble of fewer than 32 1-bits causes the remainder of the instruction to be ignored.
- **Start of Frame (ST).** A 01 pattern indicates that the start of the instruction follows.
- **Operation Code (OP).** A read instruction is indicated by 10, while a write instruction is indicated by 01.
- **PHY Address (PHYAD).** A 5-bit PHY address follows, with the MSB transmitted first. The PHY address allows a single MDIO bus to access multiple PHY chips.
- **Register Address (REGAD).** A 5-bit register address follows, with the MSB transmitted first.
- **Turnaround (TA).** The next bit times are used to avoid contention on the MDIO pin when a read operation is performed. When a write operation is being performed, 10 must be sent by the BCM53128 chip during these two bit times. When a read operation is being performed, the MDIO pin of the BCM53128 must be put in a high-impedance state during these bit times. The external PHY drives the MDIO pin to 0 during the second bit time.
- **Data.** The last 16 bits of the Instruction are the actual data bits. During a write operation, these bits are written to the MDIO pin with the most significant bit (MSB) transmitted first by the BCM53128. During a read operation, the data bits are driven by the external PHY with the MSB transmitted first.

PseudoPHY

The MDC/MDIO can be used by an external management entity to read/write register values internal to the BCM53128. This mode offers an alternative programming interface to the chip. The BCM53128 operate in slave mode with a PHY address of 30d. The following figures show the register setup flow chart for accessing the registers using the MDC/MDIO interface.

Operation	PRE	ST	OP	PHYAD	REGAD	TA	Data	Direction
Read	1 ... 1	01	10	AAAAA	RRRRR	ZZ	Z ... Z	Driven by master
						Z0	D ... D	Driven by slave
Write	1 ... 1	01	01	AAAAA	RRRRR	10	D ... D	Driven to master

See “MDC/MDIO Interface” on page 112 for more information regarding the timing requirements.

LED Interfaces

The BCM53128 provides flexible visibility per-port status of various functions. The LED Interface offers an option to display different functions for each port given the number of LED bits available. The BCM53128 provides a total of 32 LED pins. In a 5-port switch application, these are dedicated as four LED pins per port as shown in Table 30 on page 120. If one or more ports are not used in an application and are disabled using LED Enable Map register (Page 00h: Address 16h), and no more than four LED pins are to be used per port, the locations of the pins for the enabled ports are the same as if all eight ports were used, with four pins reserved per port, regardless of whether the port is enabled.

For example, if Port7~2 LED displays are disabled (value of register page 00h, address 16h = 0003), Port0 and Port1 LED display are still from LED pins LEDP28~31 (Port0), LEDP24~27 (Port1), just as if all eight ports were used. If Port1 and Port0 LED displays are disabled (value of register page 00h, address 16h = 00FC), Port5, Port6, and Port7 are still from LED pins LEDP8~11 (Port5), LEDP4~7 (Port6), and LEDP0~3 (Port7), also just as if all eight ports were used.

To set up the LED interface, configure strap pins LED_MODE[1:0] or select the desired display the functions in the LED Function 0 Control register/LED Function 1 Control register. The per-port LED display is fixed with four functions.

- To configure the strap pins, set the predefined functions to be displayed by setting the strap pins LED_MODE[1:0]. The predefined functions are described in “Signal Descriptions” on page 125. Per-port LED display is fixed four functions and occupy four LED pins.
- To configure LED display function in the two LED Function Control registers, assign each port to one of the LED Function 0 Control register and LED Function 1 Control register by enabling the bits in the LED Function Map register. The LED interface shifts out the status of the selected functions for ports enabled in the LED Enable Map register.

Only four or less than four functions can be selected, and the per-port LED display occupies four LED pins (fixed four functions). For example, if LED display function using LED Function 1 Control register is configured and the value is set to 0324h (four LED functions) or 0320h (three LED functions), the per-port LED display has four fixed functions and occupies four LED pins per port, Port7 (LEDP0~3), Port6 (LEDP4~7),Port0 (LEDP28~31).

The status of enabled ports is sent out from a higher port number to the lowest port number. The output order that is in the shift out is from LEDP[0], LEDP[1], LEDP[2],.....LEDP[31]. The output port order for LED is from high port number to low port number, and the output bit order within the port LED is form MSB to LSB.

The LED MODE MAP 0 and 1 registers can be set to select:

- LED to blinking,
- LED on, or
- LED auto mode.

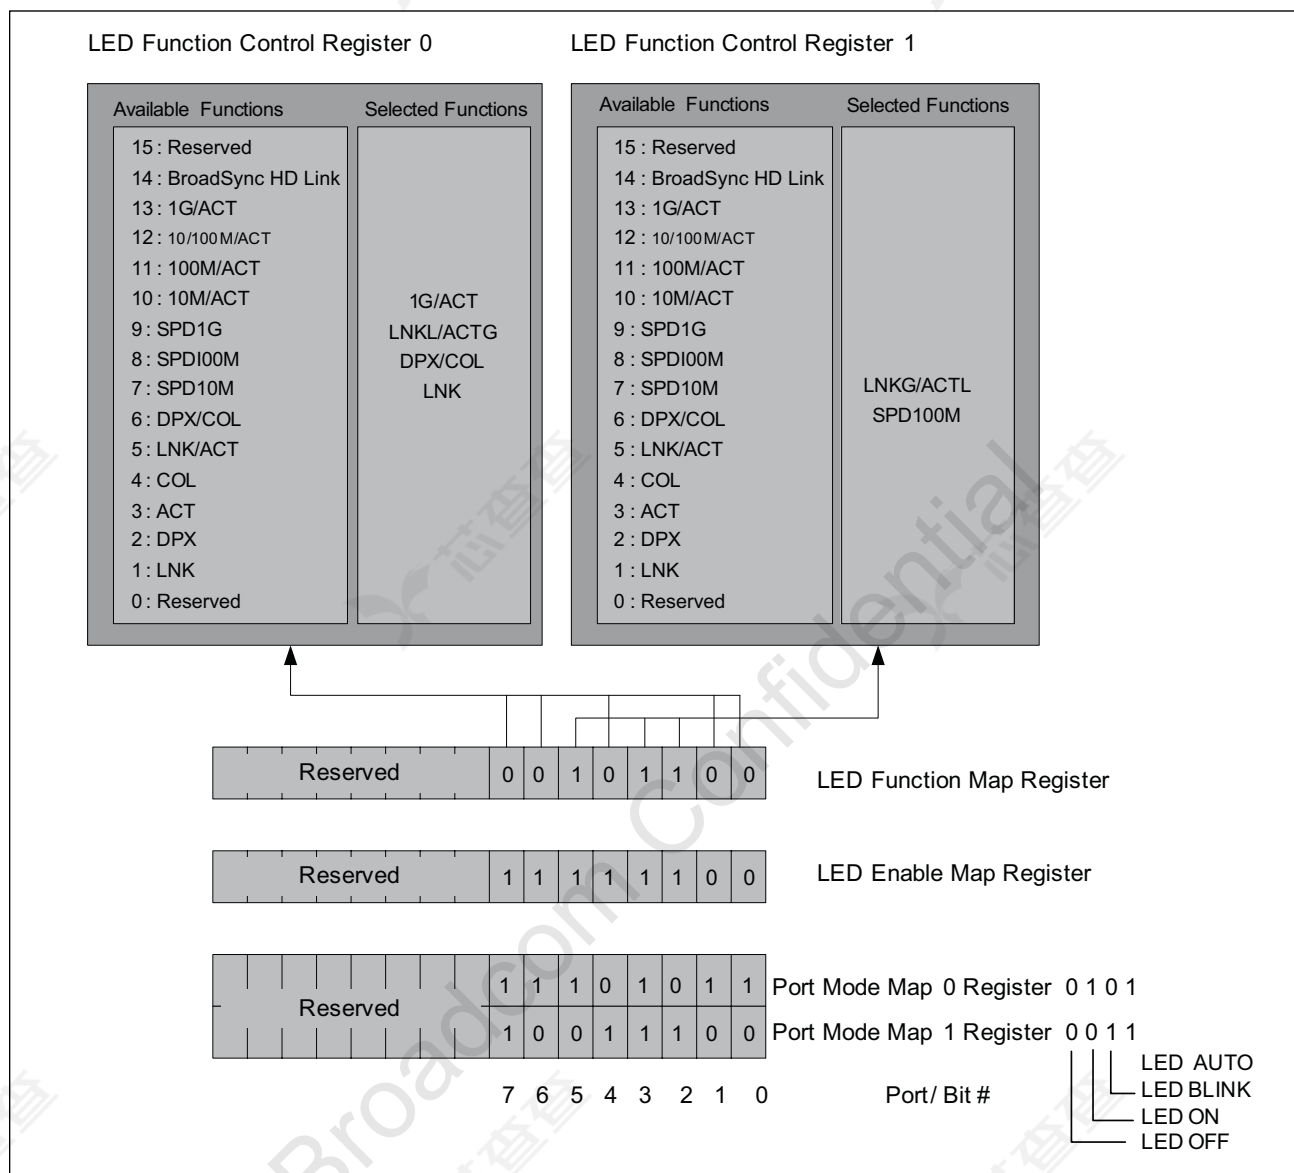

Bit 7, LED_EN, of the LED Refresh register is default enabled. When this bit 7 is enabled, the LED display of each port status is normal and truly reflects each port link up/link down status. If bit 7 is disabled, the LED status is latched in its current state.

LED signals are active low, and for the dual function LEDs, LNK, DPX, and Speed state are active low. The ACT (activity) indicator is indicated by blinking.

Table 30: LED Output Pins Per Port

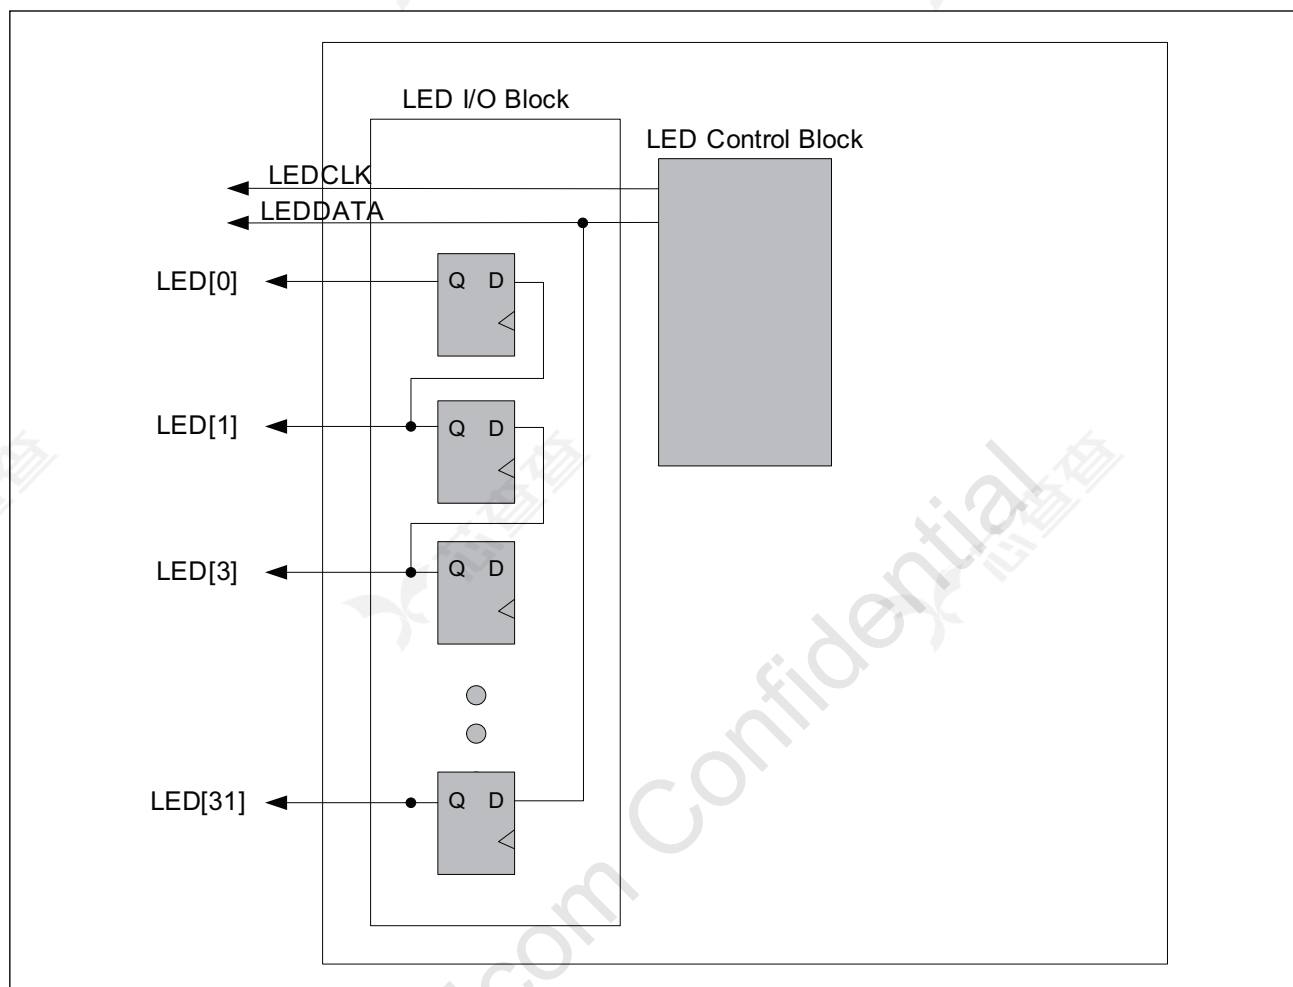

Port	LED Output Pins
Port 7	LEDP [0:3]
Port 6	LEDP [4:7]
Port 5	LEDP [8:11]
Port 4	LEDP [12:15]
Port 3	LEDP [16: 19]
Port 2	LEDP [20:23]
Port 1	LEDP [24:27]
Port 0	LEDP [28: 31]

Figure 45 shows the LED Interface register structure.

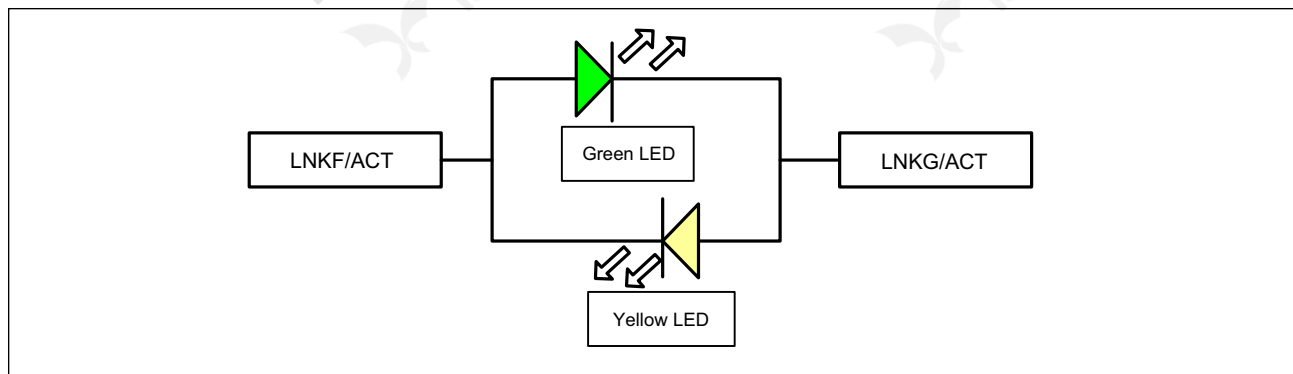

Figure 45: LED Interface Register Structure Diagram

The BCM53128 offers two LED Interfaces, Parallel LED Interface and Serial Interface. As shown in [Figure 46 on page 122](#), the source of LED status stream is the same for both interfaces; the status bit stream is based on the programmed register settings. The Parallel LED Interface provides all the shifting and storing of the status internally, so that it does not require any external shift registers, but it requires more I/O pins to be connected on the part.

The Serial LED Interface is being output through two pins (LEDDATA, LEDCLK). It saves the number of I/O pins, but it requires the user to design in the external shift registers.

Figure 46: LED Interface Block Diagram

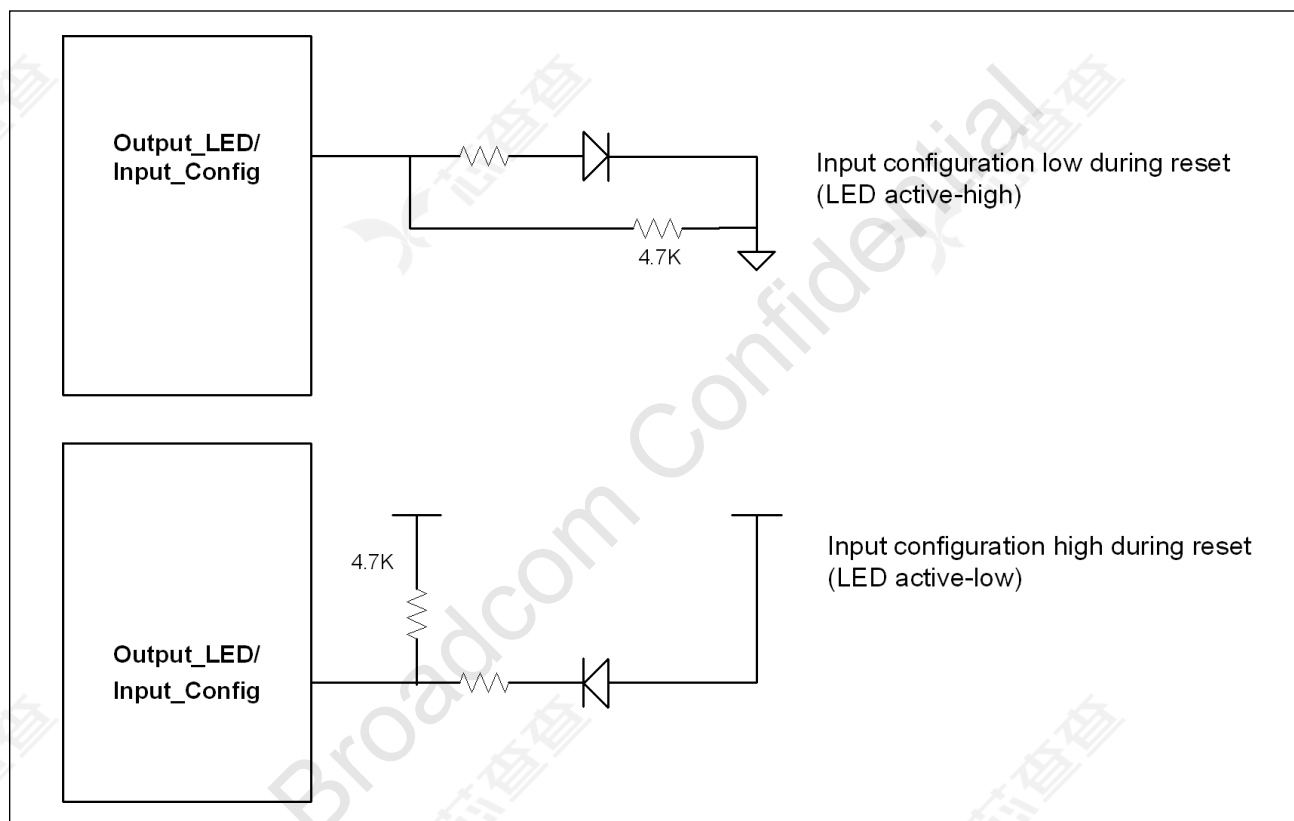

Dual LED is used for displaying more than one status using one LED cell. By packing two different colors LED into one holder, dual LED can display more than two states in one cell. Figure 47 shows a typical dual LED usage. Green LED is to display LNKG/ACT status, while Yellow LED is to display LNKF/ACT status.

Figure 47: Dual LED Usage Example

Dual Input Configuration/LED Output Function

There are LED pins that have secondary functions. These pins serve as input pins during the power-on/reset sequence. The logic level of the pin is sampled at reset and configures the secondary function. After the reset process is completed, the pin acts as an output LED during normal operation. The polarity of the output LED is determined based on the latched input value at reset. For example, if the value at the pin is high during reset, the LED output during normal operation is active-low. The user must first decide, based on the individual application, the values of the input configuration pin shown in the following table to provide the correct device configuration. The LED circuit must then be configured to accommodate either an active-low or active-high LED output (see [Figure 48](#)).

Figure 48: LED Circuit for Dual Input Configuration/LED Output Pins

Section 5: Hardware Signal Definition Table

I/O Signal Types

The following conventions are used to identify the I/O types shown in [Table 31](#). The I/O pin type is useful in referencing the DC-pin characteristics.

Table 31: I/O Signal Type Definitions

Abbreviation	Description
XYZ	Active low signal
A	Analog pin type
B	Bias pin type
CS	Continuously sampled
D	Digital pin type
DNC	Do not connect
GND	Ground
I	Input
I/O	Bidirectional
IPU	Input with internal pull-up
O _{3S}	Tristated Signal
O _{DO}	Open-drain output
O	Output
O _{PU}	Output with internal pull-up
O _{PD}	Output with internal pull-down
PD	Internal pull-down
SOR	Sample on reset
PWR	Power pin supply
PU	Internal pull-up
XT	Crystal pin type

Signal Descriptions

RESET	IPU	Hardware Reset Input. Active low Schmitt-triggered input. Resets the BCM53128.

Table 32: Signal Type Definitions (Cont.)

Signal Name	Type	Description
XTALI	I _{XT}	25 MHz Crystal Oscillator Input/Output. A continuous 25 MHz reference clock must be supplied to the BCM53128 by connecting a 25 MHz crystal between these two pins or by driving XTALI with an external 25 MHz oscillator clock. When using a crystal, connect a loading capacitor from each pin to GND. When using an oscillator, leave XTALO unconnected.
XTALO	O _{XT}	
IMP Interface		
IMP_TXCLK	I/O	<p>MII/TMII Transmit Clock. This is an input pin in MII mode, or GMII mode but speed is 100Mbps/10Mbps. It synchronizes the TXD[3:0] and connects to the PHY Entity TXC. In 100 Mbps mode, this is 25 MHz, and in 10 Mbps mode, this is 2.5 MHz. In 200 Mbps mode (TMII), this is 50 MHz.</p> <p>RvMII/RvTMII Receive Clock. This is an output pin in RvMII mode. It synchronizes the TXD[3:0] in RvMII mode and connects to the MAC/Management Entity RXC. In 100 Mbps mode, this is 25 MHz, and in 10 Mbps mode, this is 2.5 MHz. In 200 Mbps mode (RvTMII), this is 50 MHz. This output pin has an internal 25 Ω-series termination resistor. This clock is not use in the other conditions.</p>
IMP_TXD[3:0]	O	<p>GMII Transmit Data Output (first nibble). Data bits TXD[3:0] are clocked on the rising edge of TXCLK.</p> <p>RGMII Transmit Data Output. For 1000 Mbps operation, data bits TXD[3:0] are clocked on the rising edge of TXCLK, and data bits TXD[7:4] are clocked on the falling edge of TXCLK. For 10 Mbps and 100 Mbps, data bits TXD[3:0] are clocked on the rising edge of TXCLK.</p> <p>RvMII/RvTMII Receive Data Output. Clocked on the rising edge of TXCLK and connected to the RXD pins of the external MAC/Management entity.</p> <p>MII/TMII Transmit Data Output. Clocked on the rising edge of TXCLK supplied by MAC/Management entity.</p> <p>These output pins have internal 25 Ω-series termination resistor.</p>
IMP_TXD[7:4]	O	<p>GMII Transmit Data Output (second nibble). Data bits [7:4] are clocked on the rising edge of TXCLK. These output pins have internal 25 Ω-series termination resistor.</p>
IMP_TXEN	O	<p>GMII/MII/TMII Transmit Enable. Active high. TXEN indicates the data on the TXD pins are encoded and transmitted.</p> <p>RGMII Transmit Control. On the rising edge of TXCLK, TXEN indicates that a transmit frame is in progress, and the data present on the TXD[3:0] output pins is valid. On the falling edge of TXCLK, TXEN is a derivative of GMII mode TXEN and TXER signals.</p> <p>RvMII/RvTMII Receive Data Valid. Active high. Connected to RXDV pin of MAC/Management entity. Indicates that a receive frame is in progress, and the data present on the TXD[3:0] output pins is valid. This output pin has an internal 25 Ω-series termination resistor.</p>
IMP_TXER	O	<p>GMII/MII/TMII Transmit Error. Active high. Asserting TXER when TXEN is high indicates a transmission error. TXER is also used to indicate Carrier Extension when operating in half-duplex mode. This output pin has an internal 25 Ω-series termination resistor.</p>

Table 32: Signal Type Definitions (Cont.)

Signal Name	Type	Description
IMP_RXCLK	I	<p>GMII Receive Clock. 125 MHz for 1000 Mbps operation.</p> <p>RGMII Receive Clock. 125 MHz for 1000 Mbps operation, 25 MHz for 100 Mbps operation, and 2.5 MHz for 10 Mbps operation. Data bits RXD[3:0] are clocked in on the rising edge of the RXCLK, and data bits RXD[7:4] are clocked in on the falling edge of the RXCLK.</p> <p>MII Receive Clock. 25 MHz for 100 Mbps operation, and 2.5 MHz for 10 Mbps operation.</p> <p>TMII Receive Clock. 50 MHz for 200 Mbps operation.</p>
	O	<p>RvMII/RvTMII Transmit Clock. Synchronizes the RXD[3:0] in RvMII/RvTMII mode and connects to the MAC/Management entity TXC.</p> <p>RvMII Transmit Clock. 25 MHz for 100 Mbps mode, and 2.5 MHz for 10 Mbps mode.</p> <p>RvTMII Transmit Clock. 50 MHz for 200 Mbps operation.</p> <p>This output pin has an internal 25Ω-series termination resistor.</p>
IMP_RXD[3:0]	I	<p>GMII Receive Data Inputs (first nibble). Data bits RXD[3:0] are clocked on the rising edge of RXCLK.</p> <p>RGMII Receive Data Inputs. For 1000 Mbps operation, data bits RXD[3:0] are clocked-out on the rising edge of RXCLK, and data bits RXD[7:4] are clocked on the falling edge of RXCLK. In 10 Mbps and 100 Mbps modes, data bits RXD[3:0] are clocked on the rising edge of RXCLK.</p> <p>RvMII/RvTMII Transmit Data Inputs. Clocked on the rising edge of RXCLK and connected to the TXD pins of the external MAC/Management entity.</p> <p>MII/TMII Receive Data Input. Data bits RXD[3:0] are clocked on the rising edge of RXCLK.</p>
IMP_RXD[7:4]	I	<p>GMII Receive Data Inputs (second nibble). Data bits RXD[7:4] are clocked out on the rising edge of RXCLK.</p>
IMP_RXDV	I	<p>GMII/MII/TMII Receive Data Valid. Active high. RXDV indicates that a receive frame is in progress, and the data present on the RXD output pins is valid.</p> <p>RGMII Receive Data Valid. Functional equivalent of GMII RXDV on the rising edge of RXCLK and functional equivalent of a logical derivative of GMII RXDV and RXER on the falling edge of RXCLK.</p> <p>RvMII/RvTMII Transmit Enable. Active high. Indicates the data on the RXD[3:0] pins are encoded and transmitted. Connects to the TXEN of the external MAC/Management entity.</p>
IMP_RXER	I	<p>GMII/MII/TMII Receive Error. Indicates an error during the receive frame.</p>
IMP_CRS	I	<p>Carrier Sense. Active-high, indicates traffic on link</p>
IMP_COL	I	<p>Collision Detect. In half-duplex mode, active-high input indicates that a collision has occurred. In full-duplex mode, COL remains low. COL is an asynchronous input signal.</p>

Table 32: Signal Type Definitions (Cont.)

Signal Name	Type	Description
IMP_GTX_CLK	O	<p>GMII Transmit clock. This clock is driven to synchronize the transmit data in 1000 Mbps speed in GMII mode.</p> <p>RGMII Transmit Clock. This clock is driven to synchronize the transmit data in RGMII mode(125 MHz for 1000 Mbps operation, 25 MHz for 100 Mbps operation, and 2.5 MHz for 10 Mbps operation). In RGMII mode, both edges of the clock are used to align with TXD[3:0].</p> <p>IMP_GTX_CLK is used in RGMII and 1000 Mbps speed in GMII mode. IMP_TXCLK is used for MII mode, and 10/100 Mbps speed in GMII mode. This output pin has an internal 25 Ω-series termination resistor.</p>
MDC/MDIO Interface		
MDIO	I/OPD	<p>Management Data I/O. In master mode, this serial input/output data signal is used to read from and write to the MII registers of the external transceivers. In slave mode, it is used by an external entity to read/write to the switch registers via the Pseudo-PHY. See the MDC/MDIO interface for more information.</p>
MDC	I/OPD	<p>Management Data Clock. In master mode, this 2.5 MHz clock sourced by BCM53128 to the external PHY device. In slave mode, it is sourced by an external entity.</p>

Table 32: Signal Type Definitions (Cont.)

Signal Name	Type	Description
Test Interface		
TCK	IPU	JTAG Test Clock Input. Clock Input used to synchronize JTAG control and data transfers. If unused, may be left unconnected.
TDI	IPU	JTAG Test Data Input. Serial data input to the JTAG TAP Controller. Sampled on the rising edge of TCK. If unused, may be left unconnected. Shared with MOSI.
TDO	O	JTAG Test Data Output.
TMS	IPU	JTAG Mode Select Input.
TRST	IPU	JTAG Test Reset. Active low. Resets the JTAG controller. This signal must be pulled low during normal operation.
Configuration/GPIO Pins		
CLK_FREQ1/GPIO1	IPD, SOR	CLK_FREQ1 or GPIO bit 1
CLK_FREQ0/GPIO0	IPU, SOR	CLK_FREQ0 or GPIO bit 0 System Clock Selection. Determines rate of system clock via CLK_FREQ[1:0] value. 00 = 83 MHz 01 = 91 MHz (normal operation) 10 = 100 MHz 11 = 111 MHz
CPU_EEPROM_SEL	IPU, SOR	CPU or EEPROM Interface Selection. CPU_EEPROM_SEL = 0: Enable EEPROM interface. CPU_EEPROM_SEL = 1: Enable SPI Interface, The SPI interface has to be enabled (CPU_EEPROM_SEL = 1) for Pseudo-PHY accesses through the MDC/MDIO Interface. See “ Programming Interfaces ” on page 95 for more information.
HW_FWDG_EN/ GPIO7	IPD, SOR	HW_FWDG_EN or GPIO bit7 HW_FWDG_EN. Forwarding Enable. Active high. If this pin is pulled low at power-up, frame forwarding is disabled.

Table 32: Signal Type Definitions (Cont.)

Signal Name	Type	Description
LED MODE[1]/GPIO4	Bit 0: I _{PD} ,	<p>The following are LED Mode descriptions.</p> <p>LED Mode[1] or GPIO bit4, LED_MODE[0] or GPIO bit3</p> <p>LED Mode. Users can select predefined functions to be displayed for each port by setting the bits accordingly.</p> <p>When LED MODE[1:0] = 00</p> <p>FE configuration</p> <p>SPD100M</p> <p>LNK/ACT</p> <p>PHYLED4</p> <p>GbE configuration</p> <p>SPD1G</p> <p>SPD100M</p> <p>LNK/ACT</p> <p>PHYLED4</p> <p>When LED MODE[1:0] = 01</p> <p>FE configuration</p> <p>100M/ACT</p> <p>10M/ACT</p> <p>DPX/COL</p> <p>PHYLED4</p> <p>GbE configuration</p> <p>1G/ACT</p> <p>10/100M/ACT</p> <p>DPX/COL</p> <p>PHYLED4</p> <p>When LED MODE[1:0] = 10</p> <p>FE configuration</p> <p>SPD100M</p> <p>LNK/ACT</p> <p>DPX</p> <p>GbE configuration</p> <p>SPD1G</p> <p>SPD100M</p> <p>LNK/ACT</p> <p>DPX</p>
LED MODE[0]/GPIO3	Bit 1: I _{PU} , SOR

LEDP20	O	Port 2 Parallel LED Indicators. Active low.
LEDP21	O	Port 2 Parallel LED Indicators. Active low.
LEDP22/ DIS_IMP	O, I _{PD} , SOR	This is a dual function pin. Port 2 Parallel LED Indicators. Polarity determined at reset. See “Dual Input Configuration/LED Output Function” on page 123. Disables IMP Port. Sampled on reset. 0 = Enable IMP port 1 = Disable IMP port, and external pull-up resistor is required.
LEDP23/ IMP_DUMB_FWDG_EN	O, I _{PD} , SOR	This is a dual function pin. Port 2 Parallel LED Indicators. Polarity determined at reset. See “Dual Input Configuration/LED Output Function” on page 123. IMP Port in Blocking State for Unmanaged Mode. Sampled on reset. When this pin is pulled up, the IMP port is not in management mode, the IMP port is in a regular port. 0 = Blocking for dumb mode 1 = Forwarding for dumb mode
LEDP24	O	Port 1 Parallel LED Indicators. Active low.
LEDP25	O	Port 1 Parallel LED Indicators. Active low.
LEDP26/ ENFDXFLOW	O, I _{PU} , SOR	This is a dual function pin. Port 1 Parallel LED Indicators. Polarity determined at reset. See “Dual Input Configuration/LED Output Function” on page 123. Enable Automatic Full-Duplex Flow Control. Sampled on reset. In combination with the results of auto-negotiation, sets the flow control mode. See “Flow Control” on page 69 for more information.

Table 32: Signal Type Definitions (Cont.)

Signal Name	Type	Description
LEDP27/ ENHDXFLOW	O, IPU, SOR	This is a dual function pin. Port 1 Parallel LED Indicators. Polarity determined at reset. See “Dual Input Configuration/LED Output Function” on page 123. Enable Automatic Backpressure. Sampled on reset. When this pin is pulled high, it enables half-duplex backpressure flow control when a port is configured to half-duplex. See “Flow Control” on page 69.
LEDP28	O	Port 0 Parallel LED Indicators. Active low.
LEDP29	O	Port 0 Parallel LED Indicators. Active low.
LEDP30/ IMP_TXC_DELAY	O, IPD, SOR	This is a dual function pin. Port 0 Parallel LED Indicators. Polarity determined at reset. See “Dual Input Configuration/LED Output Function” on page 123. TXCLK Clock Timing Delay. Sampled on reset. Active high. This pin enables the TXCLK to data timing delay in RGMII mode. See “RGMII Interface Timing” on page 304.
LEDP31/ IMP_RXC_DELAY	O, IPD, SOR	This is a dual function pin. Port 0 Parallel LED Indicators. Polarity determined at reset. See “Dual Input Configuration/LED Output Function” on page 123. RXCLK Clock Timing Delay. Sampled on reset. Active high. This pin enables the RXCLK to data-sampling timing delay. See “RGMII Interface Timing” on page 304.
LEDCLK	OPD	LED Shift Clock. This clock is periodically active to enable LEDDATA to shift into external registers.
LEDDATA	OPD	Serial LED Data Output. Serial LED data for all ports is shifted out when LEDCLK is active. LEDMODE[1:0] pins set the serial data content. See “LED Interface” on page 133 for a functional description of this signal.
Programming Interfaces		
SCK	IPD	SPI Serial Clock. The clock input to the BCM53128 SPI interface is supplied by the SPI master, which supports up to 2 MHz, and is enabled if CPU_EPROM_SEL is high during power-on reset.
	OPD	EEPROM Serial Clock. The clock output to an external EEPROM device, and is enabled if CPU_EPROM_SEL is low during power-on reset. See the programming interfaces for more information.
SS/CS	IPU	SPI Slave Select. Active low signal which enables an SPI interface read or write operation. Enable if CPU_EPROM_SEL is high during power-on reset.
	OPU	EEPROM Chip Select. Active high control signal that enables a read operation from an external EEPROM device. Enable if CPU_EPROM_SEL is low during power-on reset. See the programming interfaces for more information.

Table 32: Signal Type Definitions (Cont.)

Signal Name	Type	Description
MOSI/DI	I _{PU}	SPI Master-Out/Slave-in. Input signal which receives control and address information for the SPI interface, as well as serial data during write operations. Enabled if CPU_EPROM_SEL is high during power-on reset.
	O _{PU}	EEPROM Data In. Serial data input of an external EEPROM device. Enabled if CPU_EPROM_SEL is low during power-on reset. See the programming interfaces for more information.
MISO/DO	O _{PU}	SPI Master-In/Slave-Out. Output signal which transmits serial data during an SPI interface read operations. Enabled if CPU_EPROM_SEL is high during power-on reset.
	I _{PU}	EEPROM Data Out. Serial data output of an external EEPROM device. Enable if CPU_EPROM_SEL is low during power-on reset. See the programming interfaces for more information.
Serial Flash Interfaces		
FSO	O _{PD}	Serial Data Output.
FCSB	O _{PD}	Chip Select.
FCLK	O	Clock Output.
FSI	I _{PD}	Serial Data Input.
Interrupt Pin		
INT	O _{3S}	Interrupt. This interrupt pin generates an interrupt based on the configuration of the Interrupt Enable Register and the Interrupt Status Register.
Bias		
GPHY1_RDAC	B	A 1.24-k resistor to GND is required.
GPHY2_RDAC	B	A 1.24-k resistor to GND is required.
Power Interfaces		
AVDDH	PWR	3.3V Analog I/O Power.
AVDDL	PWR	1.2V Analog Core Power.
DVDD	PWR	1.2V Digital Core Power.
OVDD	PWR	Power for GMII/RGMII/MII/RvMII/TMII/RvTMII of IMP. Depends on IMP_VOL_SEL[1:0] configuration. 00 = 3.3V if IMP_VOL_SEL[1:0] 01 = 2.5V if IMP_VOL_SEL[1:0] 10 or 11 = 1.5V if IMP_VOL_SEL[1:0]
OVDD2	PWR	3.3V Digital I/O Power.
GPHY1_BAVDD	PWR	3.3V Analog Power.
GPHY2_BAVDD	PWR	3.3V Analog Power.
PLL_AVDD	PWR	1.2V Analog Power.
GPHY1_PLLDVDD	PWR	1.2V Analog Power.
GPHY2_PLLDVDD	PWR	1.2V Analog Power.
XTAL_AVDD	PWR	3.3V Analog Power.
IMP_VOL_REF	PWR	IMP Interface Reference Power. Connect this pin to ground.

Table 32: Signal Type Definitions (Cont.)

Signal Name	Type	Description
PLL_AVSS	GND	Shared Digital Ground.
XTAL_AVSS	GND	Shared Digital Ground.
EXPOSEPAD	GND	Ground.
No Connect		
NC	DNC	Do not connect.

Section 7: Register Definitions

Register Definition

BCM53128 register sets can be accessed through the programming interfaces described on [page 95](#). The register space is organized into pages, each containing a certain set of registers. [Table 33](#) lists the pages defined in the BCM53128. To access a page, the page register (0xFF) is written with the page value. The registers contained in the page can then be accessed by their addresses. See “[Programming Interfaces](#)” on [page 95](#) for more information.

Register Notations

In the register description tables, the following notation in the R/W column is used to describe the ability to read or to write:

- R/W = Read or write
- RO = Read only
- LH = Latched high
- LL = Latched low
- H = Fixed high
- L = Fixed low
- SC = Clear on read

Reserved bits must be written as the default value and ignored when read.

Port Traffic Control Register (Page 00h: Address 00h)

Table 35: Port Traffic Control Register Address Summary

Address	Description
00h	Port 0
01h	Port 1
02h	Port 2
03h	Port 3
04h	Port 4
05h	Port 5
06h	Port 6
07h	Port 7

Table 36: Port Control Register (Page 00h: Address 00h–07h)

Bit	Name	R/W	Description	Default
7:5	STP_STATE[2:0]	R/W	CPU writes the current computed states of its spanning tree algorithm for a given port. 000 = No spanning tree (default for unmanaged mode) 001 = Disabled state (default for managed mode) 010 = Blocking state 011 = Listening state 100 = Learning state 101 = Forwarding state 110–111 = Reserved	~ HW_FWDG_EN
4:2	Reserved	–	–	000
1	TX_DISABLE	R/W	0 = Enable the transmit function of the port at the MAC 0 level. 1 = Disable the transmit function of the port at the MAC level.	
0	RX_DISABLE	R/W	0 = Enable the receive function of the port at the MAC 0 level. 1 = Disable the receive function of the port at the MAC level.	

IMP Port Control Register (Page 00h: Address 08h)

Table 37: IMP Port Control Register (Page 00h: Address 08h)

Bit	Name	R/W	Description	Default
7:5	Reserved	R/W	–	–
4	RX_UCST_EN	R/W	Receive unicast enable Allow unicast frames to be forwarded to the IMP, when the IMP is configured as the frame management port, and the frame was matching address table entry. When cleared, unicast frames that meet the mirror ingress/egress rules are forwarded to the frame management port. Ignored if the IMP is not selected as the Frame Management Port.	0
3	RX_MCST_EN	R/W	Receive multicast enable Allow multicast frames to be forwarded to the IMP, when the IMP is configured as the Frame Management Port, and the frame was flooded due to no matching address table entry. When cleared, multicast frames that meet the mirror ingress/egress rules are forwarded to the frame management port.	0
2	RX_BCST_EN	R/W	Receive broadcast enable Allow broadcast frames to be forwarded to the IMP, when the IMP is configured as the Frame Management Port. When cleared, multicast frames that meet the mirror ingress/egress rules are forwarded to the frame management port.	0
1:0	Reserved	R/W	–	0

Switch Mode Register (Page 00h: Address 0Bh)

Table 38: Switch Mode Register (Page 00h: Address 0Bh)

Bit	Name	R/W	Description	Default
7:2	Reserved	RO	–	000001
1	SW_FWDG_EN	R/W	Software forwarding enable SW_FWDG_EN = 1: Frame forwarding is enabled. SW_FWDG_EN = 0: Frame forwarding is disabled. Managed switch implementations should be configured to disable forwarding on power-on to allow the processor to configure the internal address table and other parameters before frame forwarding is enabled.	HW_FWDG_EN
0	SW_FWDG_MODE	R/W	Software forwarding mode 0 = Unmanaged mode. 1 = Managed mode. The ARL treats reserved multicast addresses differently depending on this selection.	~HW_FWDG_EN

IMP Port State Override Register (Page 00h: Address 0Eh)

Table 39: IMP Port State Override Register (Page 00h: Address 0Eh)

Bit	Name	R/W	Description	Default
7	MII_SW_OR	R/W	MII software override 0 = Use MII hardware pin status. 1 = Use contents of this register.	0
6	Reserved	R/W	Reserved	0
5	Tx Flow Control Capability	RO	Link partner flow control capability 0 = Not PAUSE capable 1 = PAUSE capable	0
4	Rx Flow Control Capability	R/W	Link partner flow control capability 0 = Not PAUSE-capable 1 = PAUSE-capable	0
3:2	SPEED	R/W	Speed 00 = 10 Mbps 01 = 100 Mbps 10 = 1000 Mbps 11 = 200 Mbps	10
1	FDX	R/W	Full-duplex 0 = Half-duplex 1 = Full-duplex	1

Table 39: IMP Port State Override Register (Page 00h: Address 0Eh) (Cont.)

Bit	Name	R/W	Description	Default
0	LINK	R/W	Link status 0 = Link fail 1 = Link pass	0

LED Control Register (Page 00h: Address 0Fh–1Bh)

Table 40: LED Control Register Address Summary

Address	Description
0Fh	LED refresh control register
10h–11h	LED function 0 control register
12h–13h	LED function 1 control register
14h–15h	LED function map control register
16h–17h	LED enable map register
18h–19h	LED mode map 0 register
1Ah–1Bh	LED mode map 1 register

LED Refresh Register (Page 00h: Address 0Fh)

Table 41: LED Refresh Register (Page 00h: Address 0Fh)

Bit	Name	R/W	Description	Default
7	LED_EN	R/W	Enable LED	1
6	POST_EXEC	R/W	Write 1 to re-start POST.	0
5	POST_PSCAN_EN	R/W	When enabled, switch scans the port during the POST period.	0
4	POST_Cable_diag_en	R/W	Enable cable diagnostics display during POST	0
3	Normal_Cable_diag_en	R/W	Enable cable diagnostics display in normal mode	0
2:0	LED_Refresh_rate	R/W	LED refresh count register (i.e., LED blinking rate) Refresh time = (N+1) * 10 ms <ul style="list-style-type: none"> • 000: Reserved • 001: 20 ms/25 Hz • 010: 30 ms/16 Hz • 011: 40 ms/12 Hz • 100: 50 ms/10 Hz • 101: 60 ms/8 Hz • 110: 70 ms/7 Hz • 111: 80 ms/6 Hz 	3h

LED Function 0 Control Register (Page 00h: Address 10h)

Table 42: LED Function 0 Control Register (Page 00h: Address 10h–11h)

Bit	Name	R/W	Description	Default
15:0	LED_FUNCTION	R/W	The following is the list of functions assigned to each bit: 15: Reserved 14: BroadSync HD Link 13: 1G/ACT 12: 10/100M/ACT 11: 100M/ACT 10: 10M/ACT 9: SPD1G 8: SPD100M 7: SPD10M 6: DPX/COL 5: LNK/ACT 4: COL 3: ACT 2: DPX 1: LNK 0: Reserved	LED MODE[1:0] = 00: 16'h0120 LED MODE[1:0] = 01: 16'h0C40 LED MODE[1:0] = 10: 16'h0124 LED MODE[1:0] = 11: 16'h0C04

LED Function 1 Control Register (Page 00h: Address 12h)

Table 43: LED Function 1 Control Register (Page 00h: Address 12h–13h)

Bit	Name	R/W	Description	Default
15:0	LED_FUNCTION	R/W	The following is the list of functions assigned to each bit: 15: Reserved 14: BroadSync HD Link 13: 1G/ACT 12: 10/100M/ACT 11: 100M/ACT 10: 10M/ACT 9: SPD1G 8: SPD100M 7: SPD10M 6: DPX/COL 5: LNK/ACT 4: COL 3: ACT 2: DPX 1: LNK 0: Reserved	LED MODE[1:0] = 00: 16'h0320 LED MODE[1:0] = 01: 16'h3040 LED MODE[1:0] = 10: 16'h0324 LED MODE[1:0] = 11: 16'h2C04

LED Function Map Register (Page 00h: Address 14h–15h)

Table 44: LED Function Map Register (Page 00h: Address 14h–15h)

Bit	Name	R/W	Description	Default
15:9	Reserved	R/W	–	0
8:0	LED_FUNC_MAP	R/W	Per port select function bit. Each port LED follows the function table specified for each port. 1: Select Function 1. 0: Select Function 0. Bits [7:0] correspond to ports [7:0].	1FFh

LED Enable Map Register (Page 00h: Address 16h–17h)

Table 45: LED Enable Map Register (Page 00h: Address 16h–17h)

Bit	Name	R/W	Description	Default
15:9	Reserved	R/W	–	0
8:0	LED_EN_MAP	R/W	Per port enable bit 1: Enable 0: Disable Bits [7:0] correspond to ports [7:0].	1FFh

LED Mode Map 0 Register (Page 00h: Address 18h–19h)

Table 46: LED Mode Map 0 Register (Page 00h: Address 18h–19h)

Bit	Name	R/W	Description	Default
15:9	Reserved	R/W	–	0
8:0	LED_MODE_MAP0	R/W	Combine with LED_MODE_MAP1 to decide per port LED output mode. Bits [7:0] correspond to ports [7:0].	1FFh

LED Mode Map 1 Register (Page 00h: Address 1Ah–1Bh)

Table 47: LED Function Map 1 Control Register (Page 00h: Address 1Ah–1Bh)

Bit	Name	R/W	Description	Default
15:9	Reserved	R/W	–	0
8:0	LED_MODE_MAP1	R/W	Per port select function bit LED_FUNC_MAP[1:0] 00: LED off 01: LED on 10: LED blinking 11: LED auto	1FFh

See “LED Interfaces” on page 119 for more information.

LED Control Register (Page 00h: Address 1Ch)

Table 48: LED Control Register (Page 00h: Address 1Ch)

Bit	Name	R/W	Description	Default
7:4	POST_LED_CTRL	R/W	<p>Post LED Control</p> <p>The four bits control the LED ON/OFF state during POST to allow dual-color LED to be tested.</p> <p>Bits[7:4] control each port four LED pins as below.</p> <p>Port 0 LEDP[31:28]</p> <p>Port 1 LEDP[27:24]</p> <p>Port 2 LEDP[23:20]</p> <p>Port 3 LEDP[19:16]</p> <p>Port 4 LEDP[15:12]</p> <p>Port 5 LEDP[11:8]</p> <p>Port 6 LEDP[7:4]</p> <p>Port 7 LEDP[3:0]</p> <p>1: The LED pin is activated during POST.</p> <p>0: The LED pin is deactivated during POST.</p>	0xF
3	DUAL_LED_CTRL	R/W	<p>Dual-color LED Test Control</p> <p>1: One side of the dual-color LED, which corresponding POST_LED_CTRL bit = 1, will be tested during POST firstly, and then test the other side of the dual-color LED, which corresponding POST_LED_CTRL bit = 0.</p> <p>0: Only one side of the dual-color LED, which corresponding POST_LED_CTRL bit = 1, will be tested during POST.</p>	0x0
2:0	Reserved	R/W	Reserved	0x0

PHY LED Control Register (Page 00h: Address 1Dh)

Table 49: PHY LED Control Register (Page 00h: Address 1Dh)

Bit	Name	R/W	Description	Default
7:4	PHY_LED_FUNC1	R/W	<p>Bit 7: PHYLED4 of LED Function 1</p> <p>Bit 6: PHYLED3 of LED Function 1</p> <p>Bit 5: PHYLED2 of LED Function 1</p> <p>Bit 4: PHYLED1 of LED Function 1</p>	<p>LED Mode[1:0] = 00: 8'h88</p> <p>LED Mode[1:0] = 01: 8'h88</p>
3:0	PHY_LED_FUNC0	R/W	<p>Bit 3: PHYLED4 of LED Function 0</p> <p>Bit 2: PHYLED3 of LED Function 0</p> <p>Bit 1: PHYLED2 of LED Function 0</p> <p>Bit 0: PHYLED1 of LED Function 0</p>	<p>LED Mode[1:0] = 10: 8'h00</p> <p>LED Mode[1:0] = 11: 8'h00</p>

Port Forward Control Register (Page 00h: Address 21h)

Table 50: Port Forward Control Register (Page 00h: Address 21h)

Bit	Name	R/W	Description	Default
7	MCST_DLF_FWD_EN	R/W	1 = Forward multicast lookup failed frames according to multicast lookup failed forward map register (Page 00h: Address 34h) 0 = Flood multicast packet if fail ARL table lookup	0
6	UCST_DLF_FWD_EN	R/W	1 = Forward unicast lookup failed frames according to Unicast Lookup failed forward map register (Page 00h: Address 32h) 0 = Flood unicast packet if fail ARL table lookup	0h
5:3	Reserved	R/W	Reserved	0
2	INRANGE_ERR_DIS	R/W	In-Range Error Discard. When bit = 1, the ingress port will discard the frames with Length field mismatch the frame length. The following is the definition of InRangeErrors. In-Range Errors Frames: The frames received with good CRC and one of the following" <ul style="list-style-type: none"> The value of Length/Type field is between 46 and 1500 inclusive and does not match the number of (MAC Client Data + PAD) data octets received. or <ul style="list-style-type: none"> The value of Length/Type field is less than 46, and the number of data octets received is greater than 46 (which does not require padding). 	0
1	OUTRANGE_ERR-DIS	R/W	Out of Range Error Discard. When bit = 1, the ingress port will discard the frames with length field between 1500 and 1536 (exclude 1500 and 1536) and with good CRC. This option only controls the length field checking, but not the frame length checking.	0
0	Reserved	R/W	Reserved	1

See "Egress PCP Remarking" on page 57 for more information.

Protected Port Selection Register (Page 00h: Address 24h–25h)

Table 51: Protected Port Selection Register (Page 00h: Address 24h–25h)

Blk	Name	R/W	Description	Default
15:9	Reserved	RO	Reserved	0
8:0	PORT_SELECT	R/W	Protected port selection Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively. 1 = Port protected. Cannot send/receive to other protected ports. 0 = Port is not protected.	0

See “Protected Ports” on page 47 for more information.

WAN Port Select Register (Page 00h: Address 26h–27h)

Table 52: WAN Port Select Register (Page 00h: Address 26h–27h)

Blk	Name	R/W	Description	Default
15:10	Reserved	RO	Reserved	0
9	Reserved	R/W	Reserved	0
8	Reserved	R/W	Reserved	0
7:0	WAN_PORT_MAP	R/W	Set assigned WAN port to 1. Bits [7:0] correspond to ports [7:0], respectively.	0

Pause Capability Register (Page 00h: Address 28h–2Bh)

Table 53: Pause Capability Register (Page 00h: Address 28h–2Bh)

Blk	Name	R/W	Description	Default
31:24	Reserved	RO	Reserved	0
23	EN_OVERRIDE	R/W	Forces the content of this register setting to be used over the auto-negotiation result.	0
22:18	Reserved	R/W	Reserved	0
17:9	EN_RX_PAUSE_CAP	R/W	Enabling the receive pause capability. Bit 17: IMP port Bits [16:9] correspond to ports [7:0], respectively.	0h
8:0	EN_TX_PAUSE_CAP	R/W	Enables the transmit pause capability. Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively.	0h

Reserved Multicast Control Register (Page 00h: Address 2Fh)

Table 54: Reserved Multicast Control Register (Page 00h: Address 2Fh)

Bit	Name	R/W	Description	Default
7	Multicast Learning	R/W	Multicast learning enable 0 = Do not learn unicast source addresses of frames that have a reserved multicast destination address. 1 = Learn unicast source addresses even from frames that have a reserved multicast destination address. See “ Address Management ” on page 57 for more information.	0
6:5	Reserved	R/W	Reserved	0
4	En_Mul_4	R/W	Specifies if packets with the destination addresses in the below range are to be forwarded to the appropriate port or dropped when operating in unmanaged mode. 01-80-C2-00-00-20 ~ 01-80-C2-00-00-2F 0 = Forward 1 = Drop	0
3	En_Mul_3	R/W	Specifies if packets with the destination addresses in the below range are to be forwarded to the appropriate port or dropped when operating in unmanaged mode. 01-80-C2-00-00-11 ~ 01-80-C2-00-00-1F 0 = Forward 1 = Drop	0
2	En_Mul_2	R/W	Specifies if packets with the destination address below are to be forwarded to the appropriate port or dropped when operating in unmanaged mode. 01-80-C2-00-00-10 0 = Forward 1 = Drop	0
1	En_mul_1	R/W	Specifies if packets with the destination addresses in the below range are to be forwarded to the appropriate port or dropped when operating in unmanaged mode. 01-80-C2-00-00-02 ~ 01-80-C2-00-00-0F 0 = Forward 1 = Drop	1
0	En_Mul_0	R/W	Specifies if packets with the destination address below are to be forwarded to the appropriate port or dropped when operating in unmanaged mode. 01-80-C2-00-00-00 0 = Forward 1 = Drop	0

See “[Multicast Addresses](#)” on [page 61](#) for more information.

Unicast Lookup Failed Forward Map Register (Page 00h: Address 32h)

Table 63: Port State Override Register (Page 00h: Address 58h–5Fh)

Bit	Name	R/W	Description	Default
7	Reserved	R/W	Reserved	—
6	Software Override	R/W	Writing 1 to this bit allows the values of the bits [7:0] to be written to the external PHY. Writing 0 to this bit prevents these values from overriding the present external PHY conditions.	0
5	TXFlow Control Enable	R/W	The value of this bit overrides the existing conditions of the external PHY port if bit 6 is written to 1. 0 = Flow control disabled for transmit traffic. 1 = Flow control enabled for transmit traffic.	0
4	RX Flow Control Enable	R/W	The value of this bit overrides the existing conditions of the external PHY port if bit 6 is written to 1. 0 = Flow control disabled for receive traffic. 1 = Flow control enabled for receive traffic.	0
3:2	Speed	R/W	The value of this bit overrides the existing conditions of the external PHY port if bit 6 is written to 1. 00 = 10 Mbps 01 = 100 Mbps 10 = 1000 Mbps 11 = Illegal state	10
1	Duplex Mode	R/W	The value of this bit overrides the existing conditions of the external PHY port if bit 6 is written to 1. 0 = Half-duplex 1 = Full-duplex	1

Table 63: Port State Override Register (Page 00h: Address 58h–5Fh) (Cont.)

Blk	Name	R/W	Description	Default
0	Link State	R/W	The value of this bit overrides the existing conditions of the external PHY port if bit 6 is written 1. 1 = Link-up 0 = Link-down	1

IMP RGMII Control Register (Page 00h: Address 60h)

Table 64: IMP RGMII Control Register (Page 00h: Address 60h)

Blk	Name	R/W	Description	Default
7:2	Reserved	R/W	Write as default. Ignore on read.	0
1	RGMII_DLL_RXC_ENAB LE	R/W	1 = RGMII RXC clock delay by DLL is enabled (delay mode) 0 = RGMII RXC clock delay by DLL is disabled (normal mode)	Strap pin IMP_RXC_DELA Y
0	RGMII_DLL_TXC_ENAB LE	R/W	1 = RGMII TXC clock delay by DLL is enabled (delay mode) 0 = RGMII TXC clock delay by DLL is disabled (normal mode)	Strap pin IMP_TXC_DELA Y

MDIO IMP Port Address Register (Page 00h: Address 78h)

Table 65: MDIO IMP PORT Address Register (Page 00h: Address 78h)

Blk	Name	R/W	Description	Default
7:5	Reserved	RO	Reserved	0
4:0	IMP_MDIO_ADDRESS	R/W	IMP PORT MDIO address	18h

Software Reset Control Register (Page 00h: Address 79h)

Table 66: Software Reset Control Register (Page 00h: Address 79h)

Blk	Name	R/W	Description	Default
7	SW_RST	R/W	Software reset (Bit4 “EN_SW_RST” MUST be enabled as well). Software reset, write “1” to activate a RESET, “0” to clear the reset state. 1 = Activate reset. 0 = Clear reset.	0
6:5	Reserved	R/O	Reserved	0
4	EN_SW_RST	R/W	Enable software reset.	0
3:0	Reserved	R/W	Reserved	0

Pause Frame Detection Control Register (Page 00h: Address 80h)

Table 67: Pause Frame Detection Control Register (Page 00h: Address 80h)

Bit	Name	R/W	Description	Default
7:1	Reserved	RO	Reserved	0
0	PAUSE_IGNORE_DA	R/W	0 = Check DA field on pause frame detection. 1 = Ignore DA field on pause frame detection.	0

Fast-Aging Control Register (Page 00h: Address 88h)

Table 68: Fast-Aging Control Register (Page 00h: Address 88h)

Bit	Name	R/W	Description	Default
7	Fast_Age_Start/Done	R/W	Set bit to 1 triggers the fast aging process. When the fast aging process is done, this bit is cleared to 0.	0
6	Reserved	R/W	Reserved	0
5	EN_AGE_MCAST	R/W	Enable Aging Multicast Entry 1: Aging multicast Entries in ARL Table 0: Disable Aging Multicast Entries in ARL Table Note: The EN_AGE_MCAST and the EN_AGE_Port can not enable (set to 1) at the same time.	0
4	EN_AGE_SPT	R/W	When set, check spanning tree ID.	0
3	EN_AGE_VLAN	R/W	When set, check VLAN ID.	0
2	EN_AGE_Port	R/W	When set, check port ID.	0
1	EN_AGE_Dynamic	R/W	When set, age out dynamic entry.	1
0	EN_AGE_Static	R/W	When set, age out static entry.	0

Fast-Aging Port Control Register (Page 00h: Address 89h)

Table 69: Fast-Aging Port Control Register (Page 00h: Address 89h)

Bit	Name	R/W	Description	Default
7:4	Reserved	R/W	Reserved	0
3:0	Fast Age Single Port	R/W	Fast age single port select Writing bits [3:0] selects the port to be fast-aged.	0

Fast-Aging VID Control Register (Page 00h: Address 8Ah–8Bh)

Table 70: Fast-Aging VID Control Register (Page 00h: Address 8Ah–8Bh)

Bit	Name	R/W	Description	Default
15:12	Reserved	R/W	Reserved	0
11:0	Fast Age Single VID	R/W	Fast age single VID select Writing bits [11:0] selects the VID to be fast-aged.	0

CPU Data 0 Share Register (Page 00h: Address B0h–B7h)

Table 71: CPU Data 0 Share Register (Page 00h: Address B0h–B7h)

Bit	Name	R/W	Description	Default
63:0	CPU_DATA_SHARE	R/W	Data to be shared by internal 8051 and external CPU	0x0

CPU Data 1 Share Register (Page 00h: Address B8h–BFh)

Table 72: CPU Data 1 Share Register (Page 00h: Address B8h–BFh)

Bit	Name	R/W	Description	Default
63:0	CPU_DATA_SHARE	R/W	Data to be shared by internal 8051 and external CPU	0x0

Page 01h: Status Registers

Table 73: Status Registers (Page 01h)

Address	Bits	Register Name
00h–01h	16	“Link Status Summary (Page 01h: Address 00h)” on page 164
02h–03h	16	“Link Status Change (Page 01h: Address 02h)” on page 165
04h–07h	32	“Port Speed Summary (Page 01h: Address 04h)” on page 165
08h–09h	16	“Duplex Status Summary (Page 01h: Address 08h)” on page 166
0Ah–0Dh	32	“Pause Status Summary (Page 01h: Address 0Ah)” on page 166
0Eh–0Fh	16	“Source Address Change Register (Page 01h: Address 0Eh)” on page 167
10h–45h	48/port	“Last Source Address Register (Page 01h: Address 10h)” on page 167
46h–EFh	–	Reserved
F0h–F7h	8	“SPI Data I/O Register (Global, Address F0h)” on page 295, bytes 0–7
F8h–FDh	–	Reserved
FEh	8	“SPI Status Register (Global, Address FEh)” on page 295
FFh	8	“Page Register (Global, Address FFh)” on page 296

Link Status Summary (Page 01h: Address 00h)

Table 74: Link Status Summary Register (Page 01h: Address 00h–01h)

Bit	Name	R/W	Description	Default
15:9	Reserved	RO	Reserved	0
8:0	LINK_STATUS	RO	Link status Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively. 0 = Link fail 1 = Link pass	0

Link Status Change (Page 01h: Address 02h)

Table 75: Link Status Change Register (Page 01h: Address 02h–03h)

Bit	Name	R/W	Description	Default
15:9	Reserved	RO	Reserved	0
8:0	LINK_STATUS_CHANGE	RO	<p>Link status change.</p> <p>Bit 8: IMP port</p> <p>Bits [7:0] correspond to ports [7:0], respectively.</p> <p>Upon change of link status, a bit remains set until cleared by a read operation.</p> <p>0 = Link status constant.</p> <p>1 = Link status change.</p>	0x1FF

Port Speed Summary (Page 01h: Address 04h)

Table 76: Port Speed Summary Register (Page 01h: Address 04h–07h)

Bit	Name	R/W	Description	Default
31:18	Reserved	PO	Reserved	0
17:0	PORT_SPEED	RO	<p>Port speed</p> <p>The speed of each port is reported based on the mapping below:</p> <ul style="list-style-type: none"> • Bits [17:16] = IMP port • Bits [15:14] = Port 7 • Bits [13:12] = Port 6 • Bits [11:10] = Port 5 • Bits [9:8] = Port 4 • Bits [7:6] = Port 3 • Bits [5:4] = Port 2 • Bits [3:2] = Port 1 • Bits [1:0] = Port 0 <p>The value of the bits are:</p> <ul style="list-style-type: none"> • 00 = 10 Mbps • 01 = 100 Mbps • 10 = 1000 Mbps • 11 = 200 Mbps (for IMP port only) 	0x2AAAA

Duplex Status Summary (Page 01h: Address 08h)

Table 77: Duplex Status Summary Register (Page 01h: Address 08h–09h)

Bit	Name	R/W	Description	Default
15:9	Reserved	RO	Reserved	0
8:0	DUPLEX_STATE	RO	Duplex state Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively. 0 = Half-duplex 1 = Full-duplex	0x1FF

Pause Status Summary (Page 01h: Address 0Ah)

Table 78: PAUSE Status Summary Register (Page 01h: Address 0Ah–0Dh)

Bit	Name	R/W	Description	Default
31:18	Reserved	RO	Reserved	0
17:9	RECEIVE_PAUSE_STATE	RO	Pause state. Receive pause capability Bit 17: IMP port Bits [16:9] correspond to ports [7:0], respectively. 0 = Disabled 1 = Enabled	0x100
8:0	TRANSMIT_PAUSE_STAT E	RO	Transmit pause capability Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively. 0 = Disabled 1 = Enabled	0x100

Source Address Change Register (Page 01h: Address 0Eh)

Table 79: Source Address Change Register (Page 01h: Address 0Eh–0Fh)

Bit	Name	R/W	Description	Default
15:9	Reserved	RO	Reserved	0
8:0	SRC_ADDR_CHANGE	RC	Source address change Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively. The value of this bit is 1 if a change in the source address is detected on the given port. The bit remains set until cleared by a read operation. 0 = No change in source address since last read. 1 = Source address has changed since last read.	0

Last Source Address Register (Page 01h: Address 10h)

Table 80: Last Source Address Register Address Summary

Address	Description
10h–15h	Port 0
16h–1Bh	Port 1
1Ch–21h	Port 2
22h–27h	Port 3
28h–2Dh	Port 4
2Eh–33h	Port 5
34h–39h	Port 6
3Ah–3Fh	Port 7
40h–45h	IMP port

Table 81: Last Source Address (Page 01h: Address 10h–45h)

Bit	Name	R/W	Description	Default
47:0	LAST_SOURCE_ADD	RO	The 48-bit source address detected on the last packet ingressed.	0

Page 02h: Management/Mirroring Registers

Table 82: Aging/Mirroring Registers (Page 02h)

Address	Bits	Register Name
00h	8	"Global Management Configuration Register (Page 02h: Address 00h)" on page 169

Global Management Configuration Register (Page 02h: Address 00h)

Table 83: Global Management Configuration Register (Page 02h: Address 00h)

Bit	Name	R/W	Description	Default
7:6	En_IMP_Port	R/W	IMP port enable 00 = No frame management port. 01 = Reserved 10 = Enable IMP port only. All traffic to CPU from LAN and WAN ports will be forwarded to IMP port. 11 = Reserved These bits are ignored when SW_FWD_MODE = Unmanaged in the “ Switch Mode Register (Page 00h: Address 0Bh) ” on page 148.	00
5	Reserved	R/W	Reserved	0
4	Reserved	R/W	Reserved	0
3:2	Reserved	R/W	Reserved	0
1	En_Rx_BPDU	R/W	Receive BPDU enable Enables all ports to receive BPDUs and forwards to the IMP port. This bit must be set to globally allow BPDUs to be received.	0
0	Reset MIB	R/W	Reset MIB counters Resets all MIB counters for all ports to 0 (pages 20h–28h). This bit must be set and then cleared in successive write cycles to activate the reset operation.	0

IMP Port ID Register (Page 02h: Address 01h)

Table 84: IMP Port ID Register (Page 02h: Address 01h)

Bit	Name	R/W	Description	Default
7:4	Reserved	RO	Reserved	0x0
3:0	IMP_PRT_ID	RO	IMP Port ID The field specifies the port ID of the IMP port. The BCM53128 IMP is fixed at Port 8.	0x8

Broadcom Header Control Register (Page 02h: Address 03h)

Table 85: Broadcom Tag Control Register (Page 02h: Address 03h)

Bit	Name	R/W	Description	Default
7:1	Reserved	RO	Reserved	0
0	BRCM_HDR_EN	R/W	Broadcom Tag enable for IMP. Enable Broadcom header for 1 IMP port. 1 = Additional header information is inserted into the original frame, between original SA field and Type/Length fields. The tag includes the Broadcom Tag field. 0 = Without additional header information.	1

RMON MIB Steering Register (Page 02h: Address 04h)

Table 86: RMON MIB Steering Register (Page 02h: Address 04h–05h)

Bit	Name	R/W	Description	Default
15:9	Reserved	R/W	Reserved	0
8:0	Override RMON Receive	R/W	Override RMON receive Forces the RMON packet size bucket counters from the normal default of snooping on the receive side of the MAC to the transmit side. This allows the RMON bucket counters to snoop either transmit or receive, allowing full-duplex MAC support. Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively.	0

Aging Time Control Register (Page 02h: Address 06h)

Table 87: Aging Time Control Register (Page 02h: Address 06h–09h)

Bit	Name	R/W	Description	Default
31:21	Reserved	RO	Reserved	0
20	Age Change	R/W	Age change enable 1 = Set age time via bits [19:0] immediately. 0 = Age time will be changed by the new value specified in bit[19:0], after the original age time value in bit[19:0] times up.	0
19:0	AGE_TIME	R/W	Specifies the aging time in seconds for dynamically learned addresses. Maximum age time is 1,048,575s. Setting the AGE_TIME to 0 disables the aging process. For more information on ARL table aging, see “Address Aging” on page 64 .	300d

Mirror Capture Control Register (Page 02h: Address 10h)

Table 88: Mirror Capture Control Register (Page 02h: Address 10h–11h)

Blk	Name	R/W	Description	Default
15	Mirror Enable	R/W	Global mirror enable 0 = Disable mirror capture feature 1 = Enable mirror capture feature	0
14	BLK_NOT_MIR	R/W	When enabled, all traffic to MIRROR_CAPTURE_PORT is blocked, except for mirror traffic. Nonmirror traffic is disabled. 0 = No traffic blocking on mirror capture port 1 = Traffic to mirror capture port blocked unless mirror traffic	0
13:6	Reserved	R/W	Reserved	0
5:4	Reserved	R/W	Reserved	0
3:0	Capture Port	R/W	Mirror capture port ID Binary value identifies the single unique port that is designated as the port where all ingress and/or egress traffic is mirrored.	0

For additional information about port mirroring, see [“Port Mirroring” on page 48](#).

Ingress Mirror Control Register (Page 02h: Address 12h)

Table 89: Ingress Mirror Control Register (Page 02h: Address 12h–13h)

Blk	Name	R/W	Description	Default
15:14	IN_MIRROR_FILTER	R/W	Ingress mirror filter Filters frames to be forwarded to the mirror capture port, specified in “Mirror Capture Control Register (Page 02h: Address 10h)” on page 171 . 00 = Mirror all ingress frames. 01 = Mirror all ingress frames with DA = IN_MIRROR_MAC. 10 = Mirror all ingress frames with SA = IN_MIRROR_MAC. 11 = Reserved IN_MIRROR_MAC is specified in “Ingress Mirror MAC Address Register (Page 02h: Address 16h)” on page 172 .	0
13	IN_DIV_EN	R/W	Ingress divider enable The ingress divider mirrors every n^{th} ingress frame that has passed through the IN_MIRROR_FILTER (n represents the IN_MIRROR_DIV defined in “Ingress Mirror Divider Register (Page 02h: Address 14h)” on page 172). 0 = Disable ingress divider feature. 1 = Enable ingress divider feature.	0

Table 89: Ingress Mirror Control Register (Page 02h: Address 12h–13h) (Cont.)

Bit	Name	R/W	Description	Default
12:9	Reserved	R/W	Reserved	0
8:0	IN_MIRROR_MASK	R/W	Ingress mirror port mask Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively. Ports with the corresponding bit set to 1 have ingress frames mirrored to the MIRROR_CAPTURE_PORT. While multiple ports can be set as an Ingress Mirror port, severe congestion and/or frame loss may occur if excessive bandwidth from the ingress mirrored port (s) is directed to the MIRROR_CAPTURE_PORT. Setting a mirror filter via bits [15:14] or divider via bit 13 may be helpful.	0

For additional information about port mirroring, see [“Port Mirroring” on page 48](#).

Ingress Mirror Divider Register (Page 02h: Address 14h)

Table 90: Ingress Mirror Divider Register (Page 02h: Address 14h–15h)

Bit	Name	R/W	Description	Default
15:10	Reserved	R/W	Reserved	0
9:0	IN_MIRROR_DIV	R/W	Ingress mirror divider Receive frames that have passed the IN_MIRROR_FILTER rule can further be pruned to reduce the overall number of frames returned to the MIRROR_CAPTURE_PORT. When the IN_DIV_EN bit in the “Ingress Mirror Control Register (Page 02h: Address 12h)” on page 171 is set, frames that pass the IN_MIRROR_FILTER rule are further divided by n, where $n = \text{IN_MIRROR_DIV} + 1$.	0

For additional information about port mirroring, see [“Port Mirroring” on page 48](#).

Ingress Mirror MAC Address Register (Page 02h: Address 16h)

Table 91: Ingress Mirror MAC Address Register (Page 02h: Address 16h–1Bh)

Bit	Name	R/W	Description	Default
47:0	IN_MIRROR_MAC	R/W	Ingress mirror MAC address MAC address that is compared against ingress frames in accordance with the IN_MIRROR_FILTER rules in “Ingress Mirror Control Register (Page 02h: Address 12h)” on page 171 .	0

For additional information about port mirroring, see [“Port Mirroring” on page 48](#).

18h	8	"Sleep Status Register (Page 03h: Address 18h)" on page 178
20h	8	"External CPU Interrupt Trigger Register (Page 03h: Address 20h)" on page 178

Interrupt Status Register (Page 03h: Address 00h)

Table 99: Interrupt Status Register (Page 03h: Address 00h)

Bit	Name	R/W	Description	Default
31:25	Reserved	R/W	Reserved	—
24:16	Link Status Change Interrupt	R/W	Each bit is set when the corresponding port status is changed. 0 = No link status change 1 = Link status change Bit [24]: IMP port Bits [23:16]: Port[7:0]	—
15:1	Reserved	R/W	Reserved	—
0	IMP_Sleep_Timer_Run	R/W	Indicates the IMP port timer has been triggered.	—

Interrupt Enable Register (Page 03h: Address 08h)

Table 100: Interrupt Enable Register (Page 03h: Address 08h)

Bit	Name	R/W	Description	Default
31:25	Reserved	R/W	Reserved	—
24:16	Link Status Change Interrupt Enable	R/W	Each bit is set when the corresponding port status is changed. 0 = Disable interrupt 1 = Enable interrupt Bit [24]: IMP port Bits [23:16]: Port[7:0]	—
15:1	Reserved	R/W	Reserved	—
0	IMP_Sleep_Timer_Run_Enable	R/W	Indicates the IMP port timer has been triggered.	—

IMP Sleep Timer Register (Page 03h: Address 10h)

Table 101: IMP Sleep Timer Register (Page 03h: Address 10h)

Bit	Name	R/W	Description	Default
15:13	Reserved	R/W	Reserved	0x0
12:0	IMP Sleep Timer	R/W	The configuration value of IMP port sleep timer to indicate the desired sleep recovery time (i.e., wake-up time). When the timer is set by the CPU to a non-zero value, it puts the IMP port to sleep. The wake-up time is the set value decrease 1. The unit is in 1 μ sec.	0x0

Sleep Status Register (Page 03h: Address 18h)

Table 102: Sleep Status Register (Page 03h: Address 18h)

Bit	Name	R/W	Description	Default
7:1	Reserved	RO	Reserved	0x0
0	IMP_Port_Sleep_STS	RO	<p>IMP Port Sleep Status.</p> <p>0 = IMP port is not in IMP_Sleep mode, whenever either the reset or the counter of IMP Sleep Timer is equal to zero.</p> <p>Note: The port is in IMP_SLEEP INIT state.</p> <p>1 = IMP port is in IMP_Sleep mode, when the counter of IMP Sleep Timer is not equal zero.</p> <p>Note: The port is not in IMP_SLEEP INIT state.</p>	0x0

External CPU Interrupt Trigger Register (Page 03h: Address 20h)

Table 103: External CPU Interrupt Trigger Register (Page 03h: Address 20h)

Bit	Name	R/W	Description	Default
7:1	Reserved	RO	Reserved	0x0
0	EXT_CPU_INT	R/W	<p>External CPU to internal 8051 Interrupt Trigger.</p> <p>The External CPU trigger is an interrupt to the internal 8051 by setting the bit to 1.</p>	0x0

Global ARL Configuration Register (Page 04h: Address 00h)

Table 105: Global ARL Configuration Register (Page 04h: Address 00h)

Bit	Name	R/W	Description	Default
7:5	Reserved	RO	Reserved	0
4	Reserved	—	Reserved	0
3	Reserved	RO	Reserved	0
2	AGE_Accelerate	R/W	When enabled, the aging time is reduced by 1/128. 1 = Accelerate the aging 128 times 0 = Keep the original age process	0
1	Reserved	RO	—	1
0	Hash Disable	R/W	Hash function disable Disables the hash function of the ARL table so that entries are directly mapped to the table instead of being hashed to an index. 1 = Disable hash function 0 = Enable hash function For more information see "Address Table Organization" on page 58.	0

BPDU Multicast Address Register (Page 04h: Address 04h)

Table 106: BPDU Multicast Address Register (Page 04h: Address 04h–09h)

Bit	Name	R/W	Description	Default
47:0	BPDU_MC_ADDR	R/W	BPDU multicast address 1 Defaults to the IEEE 802.1 defined reserved multicast address for the bridge group address. Programming to an alternate value allows support of proprietary protocols in place of the normal spanning tree protocol. Frames with a matching DA to this address are forwarded to the designated management port.	01-80-c2-00-00-00

Multiport Control Register (Page 04h: Address 0Eh–0Fh)

Table 107: Multiport Control Register (Page 04h: Address 0Eh–0Fh)

Bit	Name	R/W	Description	Default
15	MPORT0_TS-EN	R/W	Mport 0 Time Sync Enable 1: Packet will be time-stamped if forwarded to CPU. MPORT_VECTOR0 should be programmed to CPU only if this bit is set. 0: Packet will not be time-stamped	0
14:12	Reserved	RO	Reserved	0
11:10	MPORT_CTRL5	R/W	Multiport 5 Control 00: Disable Multiport 5 Forward. 10: Compare MPORT_ADD5 only; Forward based on MPORT_Vector 5 if matched. 01: Compare MPORT_ETYPE5 only; Forward based on MPORT_Vector 5 if matched. 11: Compare MPORT_ETYPE5 and MPORT_ADD5; Forward based on MPORT_Vector 5 if matched.	00
9:8	MPORT_CTRL4	R/W	Multiport 4 Control 00: Disable Multiport 4 Forward. 10: Compare MPORT_ADD4 only; Forward based on MPORT_Vector 4 if matched. 01: Compare MPORT_ETYPE4 only; Forward based on MPORT_Vector 4 if matched. 11: Compare MPORT_ETYPE4 and MPORT_ADD4; Forward based on MPORT_Vector 4 if matched.	00
7:6	MPORT_CTRL3	R/W	Multiport 3 Control 00: Disable Multiport 3 Forward. 10: Compare MPORT_ADD3 only; Forward based on MPORT_Vector 3 if matched. 01: Compare MPORT_ETYPE3 only; Forward based on MPORT_Vector 3 if matched. 11: Compare MPORT_ETYPE3 and MPORT_ADD3; Forward based on MPORT_Vector 3 if matched.	00
5:4	MPORT_CTRL2	R/W	Multiport 2 Control 00: Disable Multiport 2 Forward. 10: Compare MPORT_ADD2 only; Forward based on MPORT_Vector 2 if matched. 01: Compare MPORT_ETYPE2 only; Forward based on MPORT_Vector 2 if matched. 11: Compare MPORT_ETYPE2 and MPORT_ADD2; Forward based on MPORT_Vector 2 if matched.	00

Table 107: Multiport Control Register (Page 04h: Address 0Eh–0Fh) (Cont.)

Bit	Name	R/W	Description	Default
3:2	MPORT_CTRL1	R/W	Multiport 1 Control 00: Disable Multiport 1 Forward. 10: Compare MPORT_ADD1 only; Forward based on MPORT_Vector 1 if matched. 01: Compare MPORT_ETYPE1 only; Forward based on MPORT_Vector 1 if matched. 11: Compare MPORT_ETYPE1 and MPORT_ADD1; Forward based on MPORT_Vector 1 if matched.	00
1:0	MPORT_CTRL0	R/W	Multiport 0 Control 00: Disable Multiport 0 Forward. 10: Compare MPORT_ADD0 only; Forward based on MPORT_Vector 0 if matched. 01: Compare MPORT_ETYPE0 only; Forward based on MPORT_Vector 0 if matched. 11: Compare MPORT_ETYPE0 and MPORT_ADD0; Forward based on MPORT_Vector 0 if matched.	00

Multiport Address N (N=0–5) Register (Page 04h: Address 10h)

Table 108: Multiport Address Register Address Summary

Address	Description
10h–17h	Multiport ETYPE Address 0
20h–27h	Multiport ETYPE Address 1
30h–37h	Multiport ETYPE Address 2
40h–47h	Multiport ETYPE Address 3
50h–57h	Multiport ETYPE Address 4
60h–67h	Multiport ETYPE Address 5

Bit	Name	R/W	Description	Default
64:48	MPORT_ETYPE	R/W	Multiport Ethernet Type Allows a frames with a matching MPORT_ETYPE to this Length Type field to be forwarded to any programmable group of ports on the chip, as defined in the bit map in the Multiport Vector Register. Must be enabled using the MPORT_CTRL bit in the Multiport Control Register.	0000

Table 109: Multiport Address Register (Page 04h: Address 10h–17h, 20h–27h, 30h–37h, 40h–47h, 50h–57h, 60h–67h) (Cont.)

Bit	Name	R/W	Description	Default
47:0	MPORT_ADDR	R/W	Multiport Address Allows a frames with a matching DA to this address to be forwarded to any programmable group of ports on the chip, as defined in the bit map in the Multiport Vector Register. Must be enabled using the MPORT_CTRL bit in the Multiport Control Register.	0000000 00000

Multiport Vector N (N = 0–5) Register (Page 04h: Address 18h)

Table 110: Multiport Vector Register Address Summary

Address	Description
18h–1Bh	Multiport Vector 0
28h–2Bh	Multiport Vector 1
38h–3Bh	Multiport Vector 2
48h–4Bh	Multiport Vector 3
58h–5Bh	Multiport Vector 4
68h–6Bh	Multiport Vector 5

Table 111: Multiport Vector Register (Page 04h: Address 18h–1Bh, 28h–2Bh, 38h–3Bh, 48h–4Bh, 58h–5Bh, 68h–6Bh)

Bit	Name	R/W	Description	Default
31:9	Reserved	R/O	Reserved	0
8:0	MPORT_VCTR_N	R/W	Multiport Vector A bit mask corresponding to the physical ports on the chip. A frame with a DA matching the content of the Multiport Address Register will be forwarded to each port with a bit set in the Multiport Vector bit map. Bits[7:0] correspond to ports[7:0] Bit 8: Management Port (MII Management)	0

F0h–F7h	8	"SPI Data I/O Register (Global, Address F0h)" on page 295, bytes 0–7

Table 112: ARL/VTBL Access Registers (Page 05h) (Cont.)

Address	Bits	Register Name
F8h–FDh	–	Reserved
FEh	8	“SPI Status Register (Global, Address FEh)” on page 295
FFh	8	“Page Register (Global, Address FFh)” on page 296

ARL Table Read/Write Control Register (Page 05h: Address 00h)

Table 113: ARL Table Read/Write Control Register (Page 05h: Address 00h)

Bit	Name	R/W	Description	Default
7	START/DONE	R/W (SC)	Start/done command Write as 1 to initiate a read/write command to the ARL table. The bit returns to 0 to indicate that a read/write operation is complete.	0
6:1	Reserved	RO	Reserved	–
0	ARL_R/W	R/W	ARL table read/write bit Specifies whether the ARL command is a read or write operation. 1 = Read 0 = Write	0

For more information, see [“Accessing the ARL Table Entries” on page 63](#).

MAC Address Index Register (Page 05h: Address 02h)

Table 114: MAC Address Index Register (Page 05h: Address 02h–07h)

Bit	Name	R/W	Description	Default
47:0	MAC_ADDR_INDXX	R/W	MAC address index The ARL table read/write command uses this 48-bit address to index the ARL table. When IEEE 802.1Q is enabled, the ARL table is indexed by a combined hash of the MAC_ADDR_INDXX and the VID_TBL_INDXX, defined in the “VLAN ID Index Register (Page 05h: Address 08h)” on page 186 . For more information, see “Accessing the ARL Table Entries” on page 63 .	0

VLAN ID Index Register (Page 05h: Address 08h)

Table 115: VLAN ID Index Register (Page 05h: Address 08h–09h)

Blk	Name	R/W	Description	Default
15:12	Reserved	R/W	Reserved	0
11:0	VID_INDXX	R/W	VLAN ID index When IEEE 802.1Q is enabled, the VLAN ID Index is used with the MAC_ADDR_INDXX, defined in the “MAC Address Index Register (Page 05h: Address 02h)” on page 185, to form the hash index for which status is to be read or written. For more information, see “Accessing the ARL Table Entries” on page 63.	0

ARL Table MAC/VID Entry N (N=0-3) Register (Page 05h: Address 10h)

Table 116: ARL Table MAC/VID Entry N (N=0-3) Register Address Summary

Address	Description
10h–17h	ARL Table MAC/VID Entry 0
20h–27h	ARL Table MAC/VID Entry 1
30h–37h	ARL Table MAC/VID Entry 2
40h–47h	ARL Table MAC/VID Entry 3

Table 117: ARL Table MAC/VID Entry N (N=0-3) Register (Page 05h: Address 10h–17h, 20h–27h, 30h–37h, 40h–47h)

Blk	Name	R/W	Description	Default
63:60	Reserved	R/O	Reserved	0
59:48	VID_N	R/W	VID entry N The VID field is either read from or written to the ARL table entry N. The VID is a “don’t-care” field when IEEE 802.1Q is disabled.	0
47:0	MACADDR_N	R/W	MAC address entry N The 48-bit MAC Address field to be either read from or written to the ARL table entry N.	0

Note: Together, the “ARL Table MAC/VID Entry N (N=0-3) Register (Page 05h: Address 10h)” on page 186 and the “ARL Table Data Entry N (N = 0–3) Register (Page 05h: Address 18h)” on page 187 compose a complete entry in the ARL table. For more information, see “Accessing the ARL Table Entries” on page 63.

ARL Table Data Entry N (N = 0–3) Register (Page 05h: Address 18h)

Table 118: ARL Table Data Entry N (N=0-3) Register Address Summary

Address	Description
18h–1Bh	ARL Table Data Entry 0
28h–2Bh	ARL Table Data Entry 1
38h–3Bh	ARL Table Data Entry 2
48h–4Bh	ARL Table Data Entry 3

Table 119: ARL Table Data Entry N (N=0-3) Register (Page 05h: Address 18h–1Bh, 28h–2Bh, 38h–3Bh, 48h–4Bh)

Bit	Name	R/W	Description	Default
31:17	Reserved	RO	Reserved	0
16	VALID_N	R/W	Valid bit entry N Write this bit to 1 to indicate that a valid MAC address is stored in the MACADDR_N field defined in the “ ARL Table MAC/VID Entry N (N=0-3) Register (Page 05h: Address 10h) ” on page 186 , and that the entry has not aged out. Reset when an entry is empty. This information is read from or written to the ARL table during a read/write command.	0
15	STATIC_N	RW	Static bit entry N Write this bit to 1 to indicate that the entry is controlled by the external register control. When cleared, the internal learning and aging process controls the validity of the entry. This information is read from or written to the ARL table during a read/write command.	0
14	AGE_N	R/W	Age bit entry N Write this bit to 1 to indicate that an address entry has been learned or accessed. This bit is set to 0 by the internal aging algorithm. If the internal aging process detects that a valid entry has remained unused for the period set by the AGE_TIME (defined in the “ Aging Time Control Register (Page 02h: Address 06h) ” on page 170) and the entry has not been marked as static, the entry has the valid bit cleared. The age bit is ignored if the entry has been marked as Static. This information is read from or written to the ARL table during a read/write command.	0

Table 119: ARL Table Data Entry N (N=0-3) Register (Page 05h: Address 18h–1Bh, 28h–2Bh, 38h–3Bh, 48h–4Bh) (Cont.)

Bit	Name	R/W	Description	Default
13:11	TC_N	R/W	TC bit for MAC-based QoS entry N These bits define the TC field for MAC-based QoS packets. This information is read from or written to the ARL table during a read/write command.	0
10:9	Reserved	R/W	Reserved	0
8:0	FWD_PRT_MAP_N	R/W	Multicast Group Forward portmap entry N For multicast entries, these bits define the forward port map. Bit 8: CPU port/MII port Bits [7:0] correspond to ports [7:0], respectively.	0
	PORTID_N		Unicast Forward PortID entry N For unicast entries, these bits define the port number associated with the entry of the ARL table. Bits [8:4]: Reserved Bits [3:0]: Port ID/Port Number which identifies where the station with unique MACADDR_N is connected.	0

ARL Table Search Control Register (Page 05h: Address 50h)

Table 120: ARL Table Search Control Register (Page 05h: Address 50h)

Bit	Name	R/W	Description	Default
7	START/DONE	R/W (SC)	Start/done Write as 1 to initiate a sequential search of the ARL table. Each entry found by the search is returned to the “ ARL Table Search Data Result N (N = 0-1) Register (Page 05h: Address 68h) ” on page 190 and the “ ARL Table Search MAC/VID Result N (N=0-1) Register (Page 05h: Address 60h) ” on page 189. Reading the “ ARL Table Search Data Result N (N = 0-1) Register (Page 05h: Address 68h) ” on page 190 allows the ARL table search to continue. BCM53128 clears this bit when the ARL table search is complete.	0
6:1	Reserved	RO	Reserved	0
0	ARL_SR_VALID	RC	ARL search result valid Set by BCM53128 to indicate that an ARL entry is found by the ARL table search. The found entry is available in the “ ARL Table Search Data Result N (N = 0-1) Register (Page 05h: Address 68h) ” on page 190. This bit automatically returns to 0 after the ARL Search Result register is read.	0

For more information, see [“Accessing the ARL Table Entries” on page 63.](#)

ARL Search Address Register (Page 05h: Address 51h)

Table 121: ARL Search Address Register (Page 05h: Address 51h–52h)

Bit	Name	R/W	Description	Default
15	ARL_ADDR_VALID	RO	ARL address valid Indicates the lower 15 bits of this register contain a valid internal representation of the ARL entry that is currently being accessed. Intended for factory test/diagnostic use only.	0
14:0	ARL_ADDR	RO	ARL address 14-bit internal representation of the address of the ARL entry currently being accessed by the ARL search routine. This is not a direct address of the ARL location and is intended for factory test/diagnostic use only.	0

ARL Table Search MAC/VID Result N (N=0-1) Register (Page 05h: Address 60h)

Table 122: ARL Table Search MAC/VID Result N (N=0-1) Register Address Summary

Address	Description
60h–67h	ARL Table Search MAC/VID Result 0
70h–77h	ARL Table Search MAC/VID Result 1

Table 123: ARL Table Search MAC/VID Result N (N=0-1) Register (Page 05h: Address 60h–67h, 70h–77h)

Bit	Name	R/W	Description	Default
63:60	Reserved	RO	Reserved	0
59:48	ARL_SR_VID_N	RO	ARL search VID result These bits store the VID of the ARL table entry found by the ARL table search function.	0
47:0	ARL_SR_MAC_N	RO	ARL search MAC address result. These bits store the MAC address of the ARL table entry found by the ARL table search function.	0

For more information, see [“Accessing the ARL Table Entries” on page 63.](#)

ARL Table Search Data Result N (N = 0-1) Register (Page 05h: Address 68h)

Table 124: ARL Table Search Data Result N (N=0-1) Register Address Summary

Address	Description
68h–6Bh	ARL Table Search Data Result 0
78h–7Bh	ARL Table Search Data Result 1

Table 125: ARL Table Search Data Result N (N=0-1) Register (Page 05h: Address 68h–6Bh, 78h–7Bh)

Bit	Name	R/W	Description	Default
31:17	Reserved	RO	Reserved	0
16	ARL_SR_VALID_N	RO	ARL search valid bit result. This bit stores the valid bit of the ARL table entry found by the ARL table search function. Reading this register clears the data from the register and allows the ARL table search function to continue searching.	0
15	ARL_SR_STATIC_N	RO	ARL search static bit result. This bit stores the static bit of the ARL table entry found by the ARL table search function. Reading this register clears the data from the register and allows the ARL table search function to continue searching.	0
14	ARL_SR_AGE_N	RO	ARL search age bit result. This bit stores the Age bit of the ARL table entry found by the ARL table search function. Reading this register clears the data from the register and allows the ARL table search function to continue searching.	0
13:11	ARL_SR_TC_N	RO	ARL search TC bits result. These bits store the TC bits of the ARL table entry found by the ARL table search function. Reading this register clears the data from the register and allows the ARL table search function to continue searching.	0
10:9	Reserved	RO	Reserved	0

Table 125: ARL Table Search Data Result N (N=0-1) Register (Page 05h: Address 68h–6Bh, 78h–7Bh)

Bit	Name	R/W	Description	Default
8:0	FWD_PRT_MAP_N	R/W	Multicast Group Forward portmap entry N For multicast entries, these bits define the forward port map. Bit 8: CPU port/MII port Bits [7:0] correspond to ports [7:0]	0
	PORTID_N		Unicast Forward PortID entry N For unicast entries, these bits define the port number associated with the entry of the ARL table. Bits [8:4]: Reserved Bits [3:0]: Port ID/Port Number which identifies where the station with unique MACADDR_N is connected.	0

For more information, see [“Accessing the ARL Table Entries” on page 63.](#)

VLAN Table Read/Write/Clear Control Register (Page 05h: Address 80h)

Table 126: VLAN Table Read/Write/Clear Control Register (Page 05h: Address 80h)

Bit	Name	R/W	Description	Default
7	START/DONE	R/W (SC)	Start/done command Write as 1 to initiate a read or write or clear-table command to the VLAN table. The bit returns to 0 to indicate that the read or write or clear-table operation is complete.	0
6:2	Reserved	R/W	Reserved	0
1:0	VTBL_R/W/Clr	R/W	Read/Write/Clear-table Specifies whether the current VLAN table read/write/clear-table command is a read or write or clear-table operation. 11 = Reserved 10 = Clear-table 01 = Read 00 = Write	0

See [“Programming the VLAN Table” on page 40](#) for more information.

VLAN Table Address Index Register (Page 05h: Address 81h)

Table 127: VLAN Table Address Index Register (Page 05h: Address 81h–82h)

Blk	Name	R/W	Description	Default
15:12	Reserved	RO	Reserved	0
11:0	VTBL_ADDR_INDXX	R/W	VLAN table address index The current VLAN table read/write uses this 12-bit address to index the VLAN table.	0

See “Programming the VLAN Table” on page 40 for more information.

VLAN Table Entry Register (Page 05h: Address 83h–86h)

Table 128: VLAN Table Entry Register (Page 05h: Address 83h–86h)

Blk	Name	R/W	Description	Default
31:22	Reserved	RO	Reserved	0
21	FWD_MODE	R/W	This indicates whether the packet forwarding should be based on VLAN membership or based on ARL flow. 1: Based on VLAN membership (excluding Ingress port) 0: Based on ARL flow. Note that the VLAN membership based forwarding mode is only used for certain ISP Tagged packets received from ISP port when BCM53128 is operating in Double Tag Mode.	0
20:18	MSPT_INDEX	R/W	Index for 8 Spanning Trees	0
17:9	UNTAG_MAP	R/W	Untagged Port Map Bit 17: CPU Port/ MII Port Bits [16:9] correspond to ports [7:0], respectively. Ports written to 1 are designated as untagged VLAN ports. VLAN-tagged frames destined for these ports are untagged before they are forwarded. When the IEEE 802.1Q feature is enabled, frames sent via the CPU (MII port configured as a management port) are tagged. Note that the packet forwarded to IMP port should always be VLAN tagged.	0

Table 128: VLAN Table Entry Register (Page 05h: Address 83h–86h) (Cont.)

Bit	Name	R/W	Description	Default
8:0	FWD_MAP	R/W	Forward Port Map The VLAN-tagged Frame is allowed to be forwarded to the destination ports corresponding bits set in the Map Ports written to 1 are designated as capable of receiving VLAN-tagged frames. Bit 8: CPU Port/ MII Port Bits [7:0] correspond to Ports [7:0], respectively.	0

See [“Programming the VLAN Table” on page 40](#) for more information.

3	Auto-negotiation Ability	RO H	1 = Auto-negotiation capable 0 = Not auto-negotiation capable	1
2	Link Status	RO LL	1 = Link is up (link pass state). 0 = Link is down (link fail state).	0
1	Jabber Detect	RO LH	1 = Jabber condition detected. 0 = No jabber condition detected.	0
0	Extended Capability	RO H	1 = Extended register capabilities 0 = No extended register capabilities	1

PHY Identifier Register (Page 10h–17h: Address 04h)

Table 133: PHY Identifier Register MSB (Page 10h–17h: Address 04–07h)

Bit	Name	R/W	Description	Default
15:0	OUI	RO	Bits 3:18 of organizationally unique identifier	0362

Table 134: PHY Identifier Register LSB (Page 10h–17h: Address 06h–07h)

Bit	Name	R/W	Description	Default
15:10	OUI	RO	Bits 19:24 of organizationally unique identifier	010111
9:4	MODEL	RO	Device model number	100001
3:0	REVISION	RO	Device revision number	n^a (hex)

- a. The revision number (n) changes with each silicon revision.

The IEEE has issued an Organizationally Unique Identifier (OUI) to Broadcom Corporation. This 24-bit number allows devices developed by Broadcom to be distinguished from all other manufacturers. The OUI combined with model numbers and revision numbers assigned by Broadcom precisely identifies a device manufactured by Broadcom.

The [15:0] bits of MII register 02h (PHYID HIGH) contain OUI bits [3:18]. The [15:0] bits of MII register 03h (PHYID LOW) contain the most significant OUI bits [19:24], six manufacturer's model number bits, and four revision number bits. The two least significant OUI binary bits are not used.

Broadcom Corporation's OUI is 00-1B-E9, expressed as hexadecimal values. The binary OUI is 0000-0000-0001-1011-1110-1001. The model number for the BCM53128 is 21H. Revision numbers start with 0h and increment by 1 for each chip modification.

- PHYID HIGH[15:0] = OUI[3:18]
- PHYID LOW[15:0] = OUI[19:24] + Model[5:0] + Revision [3:0]

Auto-Negotiation Advertisement Register (Page 10h–17h: Address 08h)

Table 135: Auto-Negotiation Advertisement Register (Page 10h–17h: Address 08h–09h)

Bit	Name	R/W	Description	Default
15	Next Page	R/W	1 = Next page ability is supported. 0 = Next page ability is not supported.	0
14	Reserved	R/W	Write as 0, ignore on read.	0
13	Remote Fault	R/W	1 = Advertise remote fault is detected. 0 = Advertise no remote fault is detected.	0
12	Reserved Technology	R/W	Write as 0, ignore on read.	0
11	Asymmetric Pause	R/W	1 = Advertise asymmetric pause 0 = Advertise no asymmetric pause	1
10	Pause Capable	R/W	1 = Capable of full-duplex pause operation 0 = Not capable of pause operation	1
9	100BASE-T4 Capable	R/W	1 = 100BASE-T4 capable 0 = Not 100BASE-T4 capable	0
8	100BASE-TX Full-Duplex Capable	R/W	1 = 100BASE-TX full-duplex capable 0 = Not 100BASE-TX full-duplex capable	1
7	100BASE-TX Half-Duplex Capable	R/W	1 = 100BASE-TX half-duplex capable 0 = Not 100BASE-TX half-duplex capable	1

Auto-Negotiation Link Partner Ability Register (Page 10h–17h: Address 0Ah)

Table 136: Auto-Negotiation Link Partner Ability Register (Page 10h–17h: Address 0Ah–0Bh)

Bit	Name	R/W	Description	Default
15	Next Page	RO	1 = Link partner has next page ability. 0 = Link partner does not have next page ability.	0
14	Acknowledge	RO	1 = Link partner has received link code word. 0 = Link partner has not received link code word.	0
13	Remote Fault	RO	1 = Link partner has detected remote fault. 0 = Link partner has not detected remote fault.	0
12	Reserved Technology	RO	Write as 0, ignore on read.	0
11	Link Partner Asymmetric Pause	RO	1 = Link partner wants asymmetric pause. 0 = Link partner does not want asymmetric pause.	0
10	Pause Capable	RO	1 = Link partner is capable of pause operation. 0 = Link partner is not capable of pause operation.	0
9	100BASE-T4 Capable	RO	1 = Link partner is 100BASE-T4 capable. 0 = Link partner is not 100BASE-T4 capable.	0
8	100BASE-TX Full-Duplex Capable	RO	1 = Link partner is 100BASE-TX full-duplex capable. 0 = Link partner is not 100BASE-TX full-duplex capable.	0
7	100BASE-TX Half-Duplex Capable	RO	1 = Link partner is 100BASE-TX half-duplex capable. 0 = Link partner not 100BASE-TX half-duplex capable.	0
6	10BASE-T Full-Duplex Capable	RO	1 = Link partner is 10BASE-T full-duplex capable. 0 = Link partner is not 10BASE-T full-duplex capable.	0
5	10BASE-T Half-Duplex Capable	RO	1 = Link partner is 10BASE-T half-duplex capable. 0 = Link partner is not 10BASE-T half-duplex capable.	0
4	Protocol Selector Field	RO	Link partner protocol selector field	0
3		RO		0
2		RO		0
1		RO		0
0		RO		0

Note: As indicated by bit 5 of the 10BASE-T/100BASE-TX/1000BASE-T MII Status register, the values contained in the 10BASE-T/100BASE-TX/1000BASE-T Auto-negotiation Link Partner Ability register are only guaranteed to be valid after auto-negotiation has successfully completed.

Next Page

BCM53128 returns a 1 in bit 15 when the link partner wants to transmit Next Page information.

Acknowledge

BCM53128 returns a 1 in bit 14 when the link partner has acknowledged reception of the link code word; otherwise, BCM53128 returns a 0.

Auto-Negotiation Expansion Register (Page 10h–17h: Address 0Ch)

1	Reserved	RO	Ignore on read.	0
0	Reserved	RO	Ignore on read.	0

Test Mode

The BCM53128 can be placed in 1 of 4 transmit test modes by writing bits [15:13] of the 1000BASE-T Control register. The transmit test modes are defined in IEEE 802.3ab. When read, these bits return the last value written. For test modes 1, 2, and 4, the PHY must have auto-negotiation disabled and forced to 1000BASE-T mode and Auto-MDIX disabled.

- Disable auto-negotiation and force to 1000BASE-T mode (write to register 00h = 0x0040)
- Disable Auto-MDIX (write to register 18h, shadow value 111, bit 9 = 0)
- Enter test modes (write to register 09h, bits [15:13] = the desired test mode)

Master/Slave Configuration Enable

When bit 12 is set = 1, the BCM53128 master/slave mode is configured using the manual master/slave configuration value. When the bit is cleared, the master/slave mode is configured using the automatic resolution function. This bit returns a 1 when manual master/slave configuration is enabled; otherwise, it returns a 0.

1000BASE-T Status Register (Page 10h–17h: Address 14h)

Table 141: 1000BASE-T Status Register (Page 10h–17h: Address 14h–15h)

Bit	Name	R/W	Description	Default
15	Master/Slave Configuration Fault	RO LH	1 = Master/slave configuration fault detected. 0 = No master/slave configuration fault detected.	0
14	Master/Slave Configuration Resolution	RO	1 = Local transmitter is master. 0 = Local transmitter is slave.	0
13	Local Receiver Status	RO	1 = Local receiver is OK. 0 = Local receiver is not OK.	0
12	Remote Receiver Status	RO	1 = Remote receiver is OK. 0 = Remote receiver is not OK.	0
11	Link Partner 1000BASE-T Full-Duplex Capability	RO	1 = Link partner is 1000BASE-T full-duplex capable. 0 = Link partner is not 1000BASE-T full-duplex capable.	0
10	Link Partner 1000BASE-T Half-Duplex Capability	RO	1 = Link partner is 1000BASE-T half-duplex capable. 0 = Link partner is not 1000BASE-T half-duplex capable.	0

10	Local Receiver Status	RO LL	1 = Local receiver is OK. 0 = Local receiver is not OK since last read.	0
9	Locked	RO	1 = Descrambler is locked. 0 = Descrambler is unlocked.	0
8	Link Status	RO	1 = Link pass 0 = Link fail	0
7	CRC Error Detected	RO LH	1 = CRC error detected. 0 = No CRC error since last read.	0
6	Carrier Extension Error Detected	RO LH	1 = Carrier extension error detected since last read. 0 = No carrier extension error since last read.	0
5	Bad SSD Detected (False Carrier)	RO LH	1 = Bad SSD error detected since last read. 0 = No bad SSD error since last read.	0
4	Bad ESD Detected (Premature End)	RO LH	1 = Bad ESD error detected since last read. 0 = No bad ESD error since last read.	0
3	Receive Error Detected	RO LH	1 = Receive error detected since last read. 0 = No receive error since last read.	0
2	Transmit Error Detected	RO LH	1 = Transmit error code received since last read. 0 = No transmit error code received since last read.	0
1	Lock Error Detected	RO LH	1 = Lock error detected since last read. 0 = No lock error since last read.	0
0	MLT3 Code Error Detected	RO LH	1 = MLT3 code error detected since last read. 0 = No MLT3 code error since last read.	0

Receive Error Counter Register (Page 10h–17h: Address 24h)

Table 145: Receive Error Counter Register (Page 10h–17h: Address 24h–25h)^a

Bit	Name	R/W	Description	Default
15:0	Receive Error Counter	R/W CR	The number of noncollision packets with receive errors since last read	0000h

- a. Bits 15:0 of this register become the 10BASE-T, 100BASE-TX, 1000BASE-T Receive Error Counter when register 38h, shadow value 11011, bit 9 = 0.

Copper Receive Error Counter

When bit 9 = 0 in register 38h, shadow value 11011, this counter increments each time BCM53128 receives a 10BASE-T, 100BASE-TX, 1000BASE-T noncollision packet containing at least one receive error. This counter freezes at the maximum value of FFFFh. The counter automatically clears when read.

False Carrier Sense Counter Register (Page 10h–17h: Address 26h)

Table 146: False Carrier Sense Counter Register (Page 10h–17h: Address 26h–27h)^a

Bit	Name	R/W	Description	Default
15:8	Reserved	RO	Ignore on read.	00h
7:0	False Carrier Sense Counter	R/W CR	The number of false carrier sense events since last read.	00h

- a. Bits 7:0 of this register become the 10BASE-T/100BASE-TX/1000BASE-T Carrier Sense Counter when register 38h, shadow 11011, bit 9 = 0 and register 3Ch, bit 14 = 0.

Copper False Carrier Sense Counter

When bit 9 = 0 in register 1Ch, shadow value 11011 and bit 14 = 0 in register 3Ch, the False Carrier Sense Counter increments each time the BCM53128 detects a 10BASE-T, 100BASE-TX, 1000BASE-T false carrier sense on the receive input. This counter freezes at the maximum value of FFh. The counter automatically clears when read.

10BASE-T/100BASE-TX/1000BASE-T Packets Received with Transmit Error Codes Counter

Table 147: 10BASE-T/100BASE-TX/1000BASE-T Transmit Error Code Counter Register (Address 13h)^a

Bit	Name	R/W	Description	Default
15:8	Reserved	RO	Write as 0, ignore on read.	00h
7:0	Transmit Error Code Counter	R/W CR	The number of packets received with transmit error codes since last read.	00h

- a. Bits 7:0 of this register become the 10BASE-T/100BASE-TX/1000BASE-T packets received with transmit error codes counter when register 38h, shadow 11011, bit 9 = 0 and register 3Ch, bit 14 = 1.

Packets Received with Transmit Error Codes Counter

The BCM53128 detects a 10BASE-T/100BASE-TX/1000BASE-T packet with a transmit error code violation when bit 9 = 0 in register 38h, shadow value 11011, and when bit 14 = 1 in register 1Eh, Packets Received with Transmit Error Codes Counter increments each time. This counter freezes at the maximum value of FFh. The counter automatically clears when read.

Receiver NOT_OK Counter Register (Page 10h–17h: Address 28h)

Table 148: Receiver NOT_OK Counter Register (Page 10h–17h: Address 28h–29h)^a

Bit	Name	R/W	Description	Default
15:8	Local Receiver NOT_OK Counter	R/W CR	The number of times local receiver was NOT_OK since last read.	00h
7:0	Remote Receiver NOT_OK Counter	R/W CR	The number of times BCM53128 detected that the remote receiver was NOT_OK since last read.	00h

- a. Bits 15:0 of this register become the 10BASE-T, 100BASE-TX, or 1000BASE-T Receiver NOT_OK Counter when register 38h, shadow 11011, bit 9 = 0 and register 3Ch bit 15 = 0.

Copper Local Receiver NOT_OK Counter

When bit 9 = 0 in register 38h, shadow value 11011 and bit 15 = 0 in register 3Ch, this counter increments each time the 10BASE-T, 100BASE-TX, or 1000BASE-T local receiver enters the NOT_OK state. This counter freezes at the maximum value of FFh. The counter automatically clears when read.

Copper Remote Receiver NOT_OK Counter

When bit 9 = 0 in register 38h, shadow value 11011 and bit 15 = 0 in register 3Ch, this counter increments each time the 1000BASE-T, 100BASE-TX, or 10BASE-T remote receiver enters the NOT_OK state. This counter freezes at the maximum value of FFh. The counter automatically clears when read.

Receive CRC Counter Register (Page 10h–17h: Address 28h)

Table 149: CRC Counter Register (Page 10h–17h: Address 28h–29h)^a

Bit	Name	R/W	Description	Default
15:0	Receive CRC Counter	R/W CR	The number of times receive CRC errors were detected.	00h

- a. Bits 15:0 of this register become the 10BASE-T, 100BASE-TX, or 1000BASE-T Receive CRC Counter when register 38h, shadow 11011, bit 9 = 0 and register 3Ch bit 15 = 1.

Copper CRC Counter

When bit 9 = 0 in register 38h, shadow value 11011 and bit 15 = 1 in register 3Ch, this counter increments each time the 10BASE-T, 100BASE-TX, or 1000BASE-T detects a receive CRC error. This counter freezes at the maximum value of FFh. The counter automatically clears when read.

Expansion Register Access Register (Page 10h–17h: Address 2Eh)

Table 150: Expansion Register Access Register (Page 10h–17h: Address 2Eh–2Fh)

Bit	Name	R/W	Description	Default
15	Reserved	R/W	Write as 0, ignore on read.	0
14	Reserved	R/W	Write as 0, ignore on read.	0
13	Reserved	R/W	Write as 0, ignore on read.	0
12	Reserved	R/W	Write as 0, ignore on read.	0

10		R/W	0000 = Expansion register is not selected.	0
9		R/W		0
8		R/W	All others = Reserved (Do not use)	0
7	Expansion Register Accessed	R/W	Sets the expansion register number accessed when read/write to register 2Ah.	0
6		R/W		0
5		R/W		0
4		R/W		0
3		R/W		0
2		R/W		0
1		R/W		0
0		R/W		0

Expansion Register Select

Setting bits [11:8] to 1111 enables the reading from and writing to the Expansion registers in conjunction with register 2Ah. These bits should be cleared after the Expansion registers are accessed or when the Expansion registers are not being accessed. See “[Expansion Registers](#)” on page 229 for Expansion register detail.

Expansion Register Accessed

The Expansion registers can be accessed through register 2Ah when bits [11:8] of this register are set to 1111. The available expansion registers are listed in [Table 151](#).

Table 151: Expansion Register Select Values

Expansion Register	Register Name
00h	"Expansion Register 01h: Expansion Interrupt Status"

Auxiliary Control Shadow Value Access Register (Page 10h–17h: Address 30h)

Available 30h registers are listed in the [Table 152](#).

Table 152: Auxiliary Control Shadow Values Access Register (Page 10h–17h: Address 30h)

Shadow Value	Register Name
000	"Auxiliary Control Shadow Values Access Register (Page 10h–17h: Address 30h)" on page 212
001	"10BASE-T Register (Page 10h–17h: Address 30h, Shadow Value 001)" on page 214
010	"Power/MIU Control Register (Page 10h–17h: Address 30h, Shadow Value 010)" on page 215
100	"Miscellaneous Test Register (Page 10h–17h: Address 30h, Shadow Value 100)" on page 216
111	"Miscellaneous Control Register (Page 10h–17h: Address 30h, Shadow Value 111)" on page 217

Read from register 30h, shadow value zzz.

Table 153: Reading Register 30h

Register Reads/Writes	Description
Write register 30h, bits [2:0] = 111	This selects the miscellaneous control register, shadow value 111. All reads must be done through the miscellaneous control register.
Bit 15 = 0	This allows only bits [14:12] and bits [2:0] to be written.
Bits [14:12] = zzz	This selects shadow value register zzz to be read.
Bits [11: 3] = <don't care>	When bit 15 = 0, these bits will be ignored.
Bits [2:0] = 111	This sets the shadow register select to 111 (miscellaneous control register).
Read register 30h	Data read back is the value from shadow register zzz.

Write to register 30h, shadow value yyy.

Table 154: Writing Register 30h

Register Writes	Description
Set Bits [15:3] = Preferred write values	Bits [15:3] contain the values to which the desired bits are written.
Set Bits [2:0] = yyy	This enables shadow value register yyy to be written. For shadow value 111, bit 15 must also be written.

Table 155: Auxiliary Control Register (Page 10h–17h: Address 30h, Shadow Value 000)

Bit	Name	R/W	Description	Default
15	External Loopback	R/W	1 = External Loopback is enabled 0 = Normal operation	0
14	Receive Extended Packet Length	R/W	1 = Allow reception of extended length packets. 0 = Allow reception of normal length Ethernet packets only.	0
13	Edge Rate Control (1000BASE-T)	R/W	00 = 4.0 ns	0
12		R/W	01 = 5.0 ns	0
			10 = 3.0 ns	
			11 = 0.0 ns	
11	Reserved	R/W	Write as 0, ignore on read.	0
10	Reserved	R/W	Write as 1, ignore on read.	1
9	Reserved	R/W	Write as 0, ignore on read.	0
8	Reserved	R/W	Write as 0, ignore on read.	0
7	Reserved	R/W	Write as 0, ignore on read.	0
6	Reserved	R/W	Write as 0, ignore on read.	0
5	Edge Rate Control (100BASE-TX)	R/W	00 = 4.0 ns	0
4		R/W	01 = 5.0 ns	0
			10 = 3.0 ns	
			11 = 0.0 ns	
3	Reserved	R/W	Write as 0, ignore on read	0
2	Shadow Register Select	R/W	000 = Auxiliary control register	0
1		R/W	001 = 10BASE-T register	0
0		R/W	010 = Power/MIU control register	0
			100 = Miscellaneous test register	
			111 = Miscellaneous control register	

External Loopback

When bit 15 = 1, external loopback operation is enabled. When the bit is cleared, normal operation resumes.

Receive Extended Packet Length

When bit 14 = 1, BCM53128 can receive packets up to 9720 bytes in length when in SGMII mode.

When the bit is cleared, the BCM53128 only receives packets up to standard maximum size in length.

Edge Rate Control (1000BASE-T)

Bits [13:12] control the edge rate of the 1000BASE-T transmit DAC output waveform.

Edge Rate Control (100BASE-TX)

Bits [5:4] control the edge rate of the 100BASE-TX transmit DAC output waveform.

Shadow Register Select

See the note on “[Auxiliary Control Shadow Values Access Register \(Page 10h–17h: Address 30h\)](#)” on page 212 describing reading from and writing to register 18h.

The register set shown above is that for normal operation obtained when the lower 3 bits are 000.

10BASE-T Register

Table 156: 10BASE-T Register (Page 10h–17h: Address 30h, Shadow Value 001)

Bit	Name	R/W	Description	Default
15	Manchester Code Error	RO LH	1 = Manchester code error (10BASE-T) 0 = No Manchester code error	0
14	EOF Error	RO LH	1 = EOF error is detected (10BASE-T). 0 = No EOF error is detected.	0
13	Polarity Error	RO	1 = Channel polarity is inverted. 0 = Channel polarity is correct.	0
12	Block RX_DV Extension (IPG)	R/W	1 = Block RX_DV for four additional RXC cycles for 0 IPG. 0 = Normal operation	0
11	10BASE-T TXC Invert Mode	R/W	1 = Invert TXC output. 0 = Normal operation	0
10	Reserved	R/W	Write as 0, ignore on read	0
9	Jabber Disable	R/W	1 = Jabber function is disabled. 0 = Jabber function is enabled	0
8	Reserved	R/W	Write as 0, ignore on read.	0

Auxiliary Status Summary Register (Page 10h–17h: Address 32h)

Table 160: Auxiliary Status Summary Register (Page 10h–17h: Address 32h–33h)

Bit	Name	R/W	Description	Default
15	Auto-negotiation Complete	RO	1 = Auto-negotiation is complete. 0 = Auto-negotiation is in progress.	0
14	Auto-negotiation Complete Acknowledge	RO LH	1 = Entered auto-negotiation link is good check state. 0 = State not entered since last read.	0
13	Auto-negotiation Acknowledge Detect	RO LH	1 = Entered auto-negotiation acknowledge detect state. 0 = State not entered since last read	0
12	Auto-negotiation Ability Detect	RO LH	1 = Entered auto-negotiation ability detect state. 0 = State not entered since last read.	0
11	Auto-negotiation Next Page Wait	RO LH	1 = Entered auto-negotiation next page wait state. 0 = State not entered since last read.	0
10	Auto-negotiation HCD	RO	111 = 1000BASE-T full-duplex ^a	0
9	Current Operating Speed and Duplex Mode	RO	110 = 1000BASE-T half-duplex ^a	0
8		RO	101 = 100BASE-TX full-duplex ^a 100 = 100BASE-T4 011 = 100BASE-TX half-duplex ^a 010 = 10BASE-T full-duplex ^a 001 = 10BASE-T half-duplex ^a 000 = No highest common denominator or auto-negotiation is incomplete.	0
7	Parallel Detection Fault	RO LH	1 = Parallel link fault is detected. 0 = Parallel link fault is not detected.	0
6	Remote Fault	RO	1 = Link partner has detected a remote fault. 0 = Link partner has not detected a remote fault.	0
5	Auto-negotiation Page Received	RO LH	1 = New page has been received from the link partner. 0 = New page has not been received.	0
4	Link Partner Auto-negotiation Ability	RO	1 = Link partner has auto-negotiation capability. 0 = Link partner does not perform auto-negotiation.	0
3	Link Partner Next Page Ability	RO	1 = Link partner has next page capability. 0 = Link partner does not have next page capability.	0
2	Link Status	RO	1 = Link is up (link pass state). 0 = Link is down (link fail state).	0
1	Pause Resolution—Receive Direction	RO	1 = Enable pause receive. 0 = Disable pause receive.	0
0	Pause Resolution—Transmit Direction	RO	1 = Enable pause transmit. 0 = Disable pause transmit.	0

- a. Indicates the negotiated HCD when Auto-negotiation Enable = 1, or indicates the manually selected speed and duplex mode when Auto-negotiation Enable = 0.

Interrupt Status Register (Page 10h–17h: Address 34h)

Table 161: Interrupt Status Register (Page 10h–17h: Address 34h–35h)

Bit	Name	R/W	Description	Default
15	Energy Detect Change	RO LH	1 = Energy detect change since last read (enabled by register 1Ch, shadow 00101, bit 5 = 1). 0 = Interrupt cleared.	0
14	Illegal Pair Swap	RO LH	1 = Illegal pair swap is detected. 0 = Interrupt cleared.	0
13	MDIX Status Change	RO LH	1 = MDIX status changed since last read. 0 = Interrupt cleared.	0
12	Exceeded High Counter Threshold	RO	1 = Value in one or more counters is above 32K. 0 = All counters below are 32K.	0
11	Exceeded Low Counter Threshold	RO	1 = Value in one or more counters is above 128K. 0 = All counters below are 128K.	0
10	Auto-negotiation Page Received	RO LH	1 = Page received since last read. 0 = Interrupt cleared.	0
9	No HCD Link	RO LH	1 = Negotiated HCD, did not establish link. 0 = Interrupt cleared.	0
8	No HCD	RO LH	1 = Auto-negotiation returned HCD = none. 0 = Interrupt cleared.	0
7	Negotiated Unsupported HCD	RO LH	1 = Auto-negotiation HCD is not supported by BCM53128. 0 = Interrupt cleared.	0
6	Scrambler Synchronization Error	RO LH	1 = Scrambler synchronization error occurred since last read. 0 = Interrupt cleared.	0
5	Remote Receiver Status Change	RO LH	1 = Remote receiver status changed since last read. 0 = Interrupt cleared.	0
4	Local Receiver Status Change	RO LH	1 = Local receiver status changed since last read. 0 = Interrupt cleared.	0
3	Duplex Mode Change	RO LH	1 = Duplex mode changed since last read. 0 = Interrupt cleared.	0
2	Link Speed Change	RO LH	1 = Link speed changed since last read. 0 = Interrupt cleared.	0
1	Link Status Change	RO LH	1 = Link status changed since last read. 0 = Interrupt cleared.	0
0	Receive CRC Error	RO LH	1 = Receive CRC error occurred since last read. 0 = Interrupt cleared.	0

The $\overline{\text{INTR}}$ LED output is asserted when any bit in 10BASE-T/100BASE-TX/1000BASE-T interrupt status register is set and the corresponding bit in the 10BASE-T/100BASE-TX/1000BASE-T interrupt mask register is cleared.

Interrupt Mask Register (Page 10h–17h: Address 36h)

Table 162: Interrupt Mask Register (Page 10h–17h: Address 36h)

Bit	Name	R/W	Description	Default
15	Signal Detect/Energy Detect Change (enabled by register 1Ch, shadow 05h, bit 5 = 1)	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
14	Illegal Pair Swap	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
13	MDIX Status Change	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
12	Exceeded High Counter Threshold	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
11	MDIX Status Change	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
10	Exceeded High Counter Threshold	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
9	HCD No Link	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
8	No HCD	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
7	Negotiated Unsupported HCD	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
6	Scrambler Synchronization Error	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
5	Remote Receiver Status Change	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
4	Local Receive Status Change	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
3	Duplex Mode Change	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
2	Link Speed Change	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
1	Link Status Change	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1
0	CRC Error	R/W	1 = Interrupt masked, status bits operate normally. 0 = Interrupt enabled, status bits operate normally.	1

Interrupt Mask Vector

When bit n of the Interrupt Mask register is written to 1, the interrupt corresponding to the same bit in the Interrupt Status register is masked. The status bits still operate normally when the interrupt is masked, but do not generate an interrupt output. When this bit is written to 0, the interrupt is unmasked.

10BASE-T/100BASE-TX/1000BASE-T Register 38h Access

Reading from and writing to 10BASE-T/100BASE-TX/1000BASE-T register 38h is through register 38h bits [15:10]. The bits [14:10] set the shadow value of register 38h, and bit 15 enables the writing of the bits [9:0]. Setting bit 15 allows writing to bits [9:0] of register 38h. Before reading register 38h shadow zzzzz, writes to register 38h should be set with bit 15 = 0, and bits [14:10] to zzzzz. The subsequent register read from register 38h contains the shadow zzzzz register value. Table 163 lists all the register 38h shadow values.

Table 163: 10BASE-T/100BASE-TX/1000BASE-T Register 38h Shadow Values

Shadow Value	Register Name
00100	"Spare Control 2 Register (Page 10h–17h: Address 38h, Shadow Value 00100)" on page 221

Expansion Registers

Expansion Register 00h: Receive/Transmit Packet Counter

Expansion register 00h is enabled by writing to “[Expansion Register Access Register \(Page 10h–17h: Address 2Eh–2Fh\)](#)” bits [11:0] = ‘F00’h, and read/write access is through register 2Ah.

Table 171: Expansion Register 00h: Receive/Transmit Packet Counter

Bit	Name	R/W	Description	Default
15:0	Packet Counter (Copper Only)	R/W CR	Returns the transmitted and received packet count. 0000h	

Packet Counter (Copper Only)

The mode of this counter is set by bit 11 of “[Miscellaneous Control Register \(Page 10h–17h: Address 30h, Shadow Value 111\)](#)”. When bit 11 = 1, then receive packets (both good and bad CRC error packets) are counted. When bit 11 = 0, then transmit packets (both good and bad CRC error packets) are counted. This counter is cleared on read and freezes at FFFFh.

Expansion Register 01h: Expansion Interrupt Status

Expansion register 01h is enabled by writing to “[Expansion Register Access Register \(Page 10h–17h: Address 2Eh–2Fh\)](#)” bits [11:0] = ‘F01’h, and read/write access is through register 2Ah.

Table 172: Expansion Register 01h: Expansion Interrupt Status

Bit	Name	R/W	Description	Default
15:1	Reserved	RO	Write as 0, ignore on read	0
0	Transmit CRC Error	RO LH	1 = Transmit CRC error detected since last read. 0 = No transmit CRC error detected.	0

Transmit CRC Error

This bit indicates that a transmit CRC error has been detected since the last read.

Expansion Register 45h: Transmit CRC Enable

Expansion register 00h is enabled by writing to “[Expansion Register Access Register \(Page 10h–17h: Address 2Eh–2Fh\)](#)” bits [11:0] = ‘F45’h, and read/write access is through register 2Ah.

Table 173: Expansion Register 45h: Transmit CRC

Bit	Name	R/W	Description	Default
15:13	Reserved	R/W	Write as 0, ignore on read.	000
12	Transmit CRC enable	R/W	1 = Enable transmit CRC checker. 0 = Disable transmit CRC checker. Register 18h, shadow value 100, bit 15 must be set to a 1.	0
11:0	Reserved	R/W	Write as 0, ignore on read.	0

Transmit CRC Checker

When register 30h, Shadow Value 100, bit 15 = 1 and Expansion Register 45h, bit 12 = 1, the transmit CRC checker is enabled. When a transmit CRC error occurs, Expansion Register 01h, bit 0 = 1.

28h	IMP port

Table 175: Page 20h–28h Port MIB Registers

ADDR	Bits	Name	Description
00h–07h	64	TxOctets	The total number of good bytes of data transmitted by a port (excluding preamble, but including FCS).

Table 175: Page 20h–28h Port MIB Registers (Cont.)

ADDR	Bits	Name	Description
08h–0Bh	32	TxDropPkts	This counter is incremented every time a transmit packet is dropped due to lack of resources (e.g., transmit FIFO underflow), or an internal MAC sublayer transmit error not counted by either the TxLateCollision or the TxExcessiveCollision counters.
0Ch–0Fh	32	TxQ0PKT	The total number of good packets transmitted on COS0, which is specified in MIB queue select register when QoS is enabled.
10h–13h	32	TxBroadcastPkts	The number of good packets transmitted by a port that are directed to a broadcast address. This counter does not include errored broadcast packets or valid multicast packets.
14h–17h	32	TxMulticastPkts	The number of good packets transmitted by a port that are directed to a multicast address. This counter does not include errored multicast packets or valid broadcast packets.
18h–1Bh	32	TxUnicastPkts	The number of good packets transmitted by a port that are addressed to a unicast address.
1Ch–1Fh	32	TxCollisions	The number of collisions experienced by a port during packet transmissions.
20h–23h	32	TxSingleCollision	The number of packets successfully transmitted by a port that experienced exactly one collision.
24h–27h	32	TxMultiple Collision	The number of packets successfully transmitted by a port that experienced more than one collision.
28h–2Bh	32	TxDeferredTransmit	The number of packets transmitted by a port for which the first transmission attempt is delayed because the medium is busy.
2Ch–2Fh	32	TxLateCollision	The number of times that a collision is detected later than 512 bit-times into the transmission of a packet.
30h–33h	32	TxExcessiveCollision	The number of packets that are not transmitted from a port because the packet experienced 16 transmission attempts.
34h–37h	32	TxFramelnDisc	The number of valid packets received that are discarded by the forwarding process due to lack of space on an output queue. (Not maintained or reported in the MIB counters and located in the congestion management registers [Page 0Ah].) This attribute only increments if a network device is not acting in compliance with a flow-control request, or the BCM53128 internal flow control/buffering scheme has been misconfigured.
38h–3Bh	32	TxPausePkts	The number of PAUSE events on a given port.
3Ch–3Fh	32	TxQ1PKT	The total number of good packets transmitted on COS1, which is specified in MIB queue select register when QoS is enabled.
40h–43h	32	TxQ2PKT	The total number of good packets transmitted on COS2, which is specified in MIB queue select register when QoS is enabled.
44h–47h	32	TxQ3PKT	The total number of good packets transmitted on COS3, which is specified in MIB queue select register when QoS is enabled.
48h–4Bh	32	TxQ4PKT	The total number of good packets transmitted on COS4, which is specified in MIB queue select register when QoS is enabled.
4Ch–4Fh	32	TxQ5PKT	The total number of good packets transmitted on COS5, which is specified in MIB queue select register when QoS is enabled.

Table 175: Page 20h–28h Port MIB Registers (Cont.)

ADDR	Bits	Name	Description
50h–57h	64	RxOctets	The number of bytes of data received by a port (excluding preamble, but including FCS), including bad packets.
58h–5Bh	32	RxUndersizePkts	The number of good packets received by a port that are less than 64 bytes long (excluding framing bits, but including the FCS).
5Ch–5Fh	32	RxPausePkts	The number of PAUSE frames received by a port. The PAUSE frame must have a valid MAC control frame EtherType field (88–08h), have a destination MAC address of either the MAC control frame reserved multicast address (01-80-C2-00-00-01) or the unique MAC address associated with the specific port, a valid PAUSE Opcode (00–01), be a minimum of 64 bytes in length (excluding preamble but including FCS), and have a valid CRC. Although an IEEE 802.3-compliant MAC is only permitted to transmit PAUSE frames when in full-duplex mode with flow control enabled and with the transfer of PAUSE frames determined by the result of auto-negotiation, an IEEE 802.3 MAC receiver is required to count all received PAUSE frames, regardless of its half/full-duplex status. An indication that a MAC is in half-duplex with the RxPausePkts incrementing indicates a noncompliant transmitting device on the network.
60h–63h	32	Pkts64Octets	The number of packets (including error packets) that are 64 bytes long.
64h–67h	32	Pkts65to127Octets	The number of packets (including error packets) that are between 65 and 127 bytes long.
68h–6Bh	32	Pkts128to255Octets	The number of packets (including error packets) that are between 128 and 255 bytes long.
6Ch–6Fh	32	Pkts256to511Octets	The number of packets (including error packets) that are between 256 and 511 bytes long.
70h–73h	32	Pkts512to1023Octets	The number of packets (including error packets) that are between 512 and 1023 bytes long.
74h–77h	32	Pkts1024toMaxPktOctets	The number of packets (including error packets) that are between 1024 and MaxPacket bytes long.
78h–7Bh	32	RxOversizePkts	The number of good packets received by a port that are greater than standard max frame size.
7Ch–7Fh	32	RxJabbers	The number of packets received by a port that are longer than 1522 bytes and have either an FCS error or an alignment error.
80h–83h	32	RxAlignmentErrors	The number of packets received by a port that have a length (excluding framing bits, but including FCS) between 64 and standard max frame size, inclusive, and have a bad FCS with a nonintegral number of bytes.
84h–87h	32	RxFCSErrors	The number of packets received by a port that have a length (excluding framing bits, but including FCS) between 64 and standard max frame size, inclusive, and have a bad FCS with an integral number of bytes.
88h–8Fh	64	RxGoodOctets	The total number of bytes in all good packets received by a port (excluding framing bits but including FCS).

Table 175: Page 20h–28h Port MIB Registers (Cont.)

ADDR	Bits	Name	Description
90h–93h	32	RxDropPkts	The number of good packets received by a port that were dropped due to lack of resources (e.g., lack of input buffers) or were dropped due to lack of resources before a determination of the validity of the packet was able to be made (e.g., receive FIFO overflow). The counter is only incremented if the receive error was not counted by the RxAlignmentErrors or the RxFCSErrors counters.
94h–97h	32	RxUnicastPkts	The number of good packets received by a port that are addressed to a unicast address.
98h–9Bh	32	RxMulticastPkts	The number of good packets received by a port that are directed to a multicast address. This counter does not include errored multicast packets or valid broadcast packets.
9Ch–9Fh	32	RxBroadcastPkts	The number of good packets received by a port that are directed to the broadcast address. This counter does not include errored broadcast packets or valid multicast packets.
A0h–A3h	32	RxSACChanges	The number of times the SA of good receive packets has changed from the previous value. A count greater than 1 generally indicates the port is connected to a repeater-based network.
A4h–A7h	32	RxFragments	The number of packets received by a port that are less than 64 bytes (excluding framing bits) and have either an FCS error or an alignment error.
A8h–ABh	32	JumboPkt	The number of frames received with frame size greater than the Standard Maximum Size and less than or equal to the Jumbo Frame Size, regardless of CRC or Alignment errors. Note: InFrame count should count "the JumboPkt count with good CRC."
ACh–AFh	32	RXSymbolError	The total number of times a valid length packet was received at a port and at least one invalid data symbol was detected. Counter only increments once per carrier event and does not increment on detection of collision during the carrier event.
B0h–B3h	32	InRangeErrors	The number of frames received with good CRC and the following conditions. The value of Length/Type field is between 46 and 1500 inclusive, and does not match the number or (MAC Client Data + PAD) data octets received, OR The value of Length/Type field is less than 46, and the number of data octets received is greater than 46 (which does not require padding).
B4h–B7h	32	OutOfRangeErrors	The number of frames received with good CRC and the value of Length/Type field is greater than 1500 and less than 1536.
B8h–BBh	32	EEE Low-Power Idle Event	In asymmetric mode, this is simply a count of the number of times that the lowPowerAssert control signal has been asserted for each MAC. In symmetric mode, this is the count of the number of times both lowPowerAssert and the lowPowerIndicate (from the receive path) are asserted simultaneously.

Table 175: Page 20h–28h Port MIB Registers (Cont.)

ADDR	Bits	Name	Description
BCh–BFh	32	EEE Low-Power Duration	This counter accumulates the number of microseconds that the associated MAC/PHY is in the low-power idle state. The unit is 1 used.
C0h–C3h	32	RxDiscard	The number of good packets received by a port that were discarded by the Forwarding Process.

QoS Global Control Register (Page 30h: Address 00h)

Table 177: QoS Global Control Register (Page 30h: Address 00h)

Bit	Name	R/W	Description	Default
7	Aggregation Mode	R/W	When enable this bit, the IMP operated as the uplink port to the upstream network processor and the COS is decided from the TC based on the normal packet classification flow. Otherwise, the IMP operated as the interface to the management CPU, and the COS is decided based on the reasons for forwarding the packet to the CPU.	0
6	PORT_QOS_EN	R/W	Port-based QoS enable When port-based QoS is enabled, ingress frames are assigned a priority ID value based on the PORT_QOS_PRI bits in the “Default IEEE 802.1Q Tag Register (Page 34h: Address 10h)” on page 255. IEEE 802.1p and DiffServ priorities are disregarded. 0 = Disable port-based QoS. 1 = Enable port-based QoS. See “Quality of Service” on page 34 for more information.	0
5:4	Reserved	R/W	Reserved	0
3:2	QOS_LAYER_SEL	R/W	QoS priority selection These bits determine which QoS priority scheme is associated with the frame. See Table 1 on page 36 for more information.	0
1:0	Reserved	R/W	Reserved	0

QoS IEEE 802.1p Enable Register (Page 30h: Address 04h)

Table 178: QoS.1P Enable Register (Page 30h: Address 04h–05h)

DiffServ Priority Map 3 Register (Page 30h: Address 52h)

These bits map the DiffServ priority level to one of the eight priority ID levels in the [“TC_To_COS Mapping Register \(Page 30h: Address 62h–63h\)” on page 241](#).

Table 185: DiffServ Priority Map 3 Register (Page 30h: Address 52h–57h)

Bit	Name	R/W	Description	Default
47:45	DIFFSERV_111111_MAP	R/W	DiffServ DSCP priority tag field 111111	0
44:42	DIFFSERV_111110_MAP	R/W	DiffServ DSCP priority tag field 111110	0
41:39	DIFFSERV_111101_MAP	R/W	DiffServ DSCP priority tag field 111101	0
38:36	DIFFSERV_111100_MAP	R/W	DiffServ DSCP priority tag field 111100	0
35:33	DIFFSERV_111011_MAP	R/W	DiffServ DSCP priority tag field 111011	0
32:30	DIFFSERV_111010_MAP	R/W	DiffServ DSCP priority tag field 111010	0
29:27	DIFFSERV_111001_MAP	R/W	DiffServ DSCP priority tag field 111001	0
26:24	DIFFSERV_111000_MAP	R/W	DiffServ DSCP priority tag field 111000	0
23:21	DIFFSERV_110111_MAP	R/W	DiffServ DSCP priority tag field 110111	0
20:18	DIFFSERV_110110_MAP	R/W	DiffServ DSCP priority tag field 110110	0
17:15	DIFFSERV_110101_MAP	R/W	DiffServ DSCP priority tag field 110101	0
14:12	DIFFSERV_110100_MAP	R/W	DiffServ DSCP priority tag field 110100	0
11:9	DIFFSERV_110011_MAP	R/W	DiffServ DSCP priority tag field 110011	0

Table 185: DiffServ Priority Map 3 Register (Page 30h: Address 52h–57h) (Cont.)

Bit	Name	R/W	Description	Default
8:6	DIFFSERV_110010_MAP	R/W	DiffServ DSCP priority tag field 110010	0
5:3	DIFFSERV_110001_MAP	R/W	DiffServ DSCP priority tag field 110001	0
2:0	DIFFSERV_110000_MAP	R/W	DiffServ DSCP priority tag field 110000	0

See “Quality of Service” on page 34 for more information.

TC_To_COS Mapping Register (Page 30h: Address 62h–63h)

All the bits in Table 186 map the priority ID to one of the TX queues.

Table 186: TC_To_COS Mapping Register (Page 30h: Address 62h–63h)

Bit	Name	R/W	Description	Default
15:14	PRI_111_QID	R/W	Priority ID 111 mapped to TX Queue ID	00
13:12	PRI_110_QID	R/W	Priority ID 110 mapped to TX Queue ID	00
11:10	PRI_101_QID	R/W	Priority ID 101 mapped to TX Queue ID	00
9:8	PRI_100_QID	R/W	Priority ID 100 mapped to TX Queue ID	00
7:6	PRI_011_QID	R/W	Priority ID 011 mapped to TX Queue ID	00
5:4	PRI_010_QID	R/W	Priority ID 010 mapped to TX Queue ID	00
3:2	PRI_001_QID	R/W	Priority ID 001 mapped to TX Queue ID	00
1:0	PRI_000_QID	R/W	Priority ID 000 mapped to TX Queue ID	00

See “Quality of Service” on page 34 for more information.

CPU_To_COS Map Register (Page 30h: Address 64h–67h)

Table 187: CPU_To_COS Map Register (Page 30h: Address 64h–67h)

Bit	Name	R/W	Description	Default
31:18	Reserved	RO	–	0
17:15	Exception/Flooding Processing to CPU COS Map	R/W	The packet forwarded to the CPU for Exception Processing/Flooding reason. The COS selection is based on the highest COS values among all the reasons for the packet.	0
14:12	Protocol Snooping to CPU COS Map	R/W	The packet forwarded to the CPU for Protocol Snooping reason. The COS selection is based on the highest COS values among all the reasons for the packet.	0
11:9	Protocol Termination to CPU COS Map	R/W	The packet forwarded to the CPU for Protocol Termination reason. The COS selection is based on the highest COS values among all the reasons for the packet.	0
8:6	Switching to CPU COS Map	R/W	The packet forwarded to the CPU for Switching reason. The COS selection is based on the highest COS values among all the reasons for the packet.	0
5:3	SA Learning to CPU COS Map	R/W	The packet forwarded to the CPU for SA Learning reason. The COS selection is based on the highest COS among all the reasons for the packet.	0
2:0	Mirror to CPU COS Map	R/W	The packet forwarded to the CPU for mirroring reason. The COS selection is based on the highest COS values among all the reasons for the packet.	0

TX Queue Control Register (Page 30h: Address 80h)

Table 188: TX Queue Control Register (Page 30h: Address 80h)

Bit	Name	R/W	Description	Default
7:4	Reserved	R/W	Reserved	0
3:2	Reserved	R/W	Reserved	0
1:0	QOS_PRIORITY_CTRL	R/W	<p>Best Effort Queues Priority Control</p> <p>This field controls the best effort queues' scheduling priority. It doesn't affect the behavior of COS4 and COS5.</p> <p>00: all queues are weighted round robin</p> <p>01: COS3 is strict priority, COS2-COS0 are weighted round robin.</p> <p>10: COS3 and COS2 is strict priority, COS1-COS0 are weighted round robin.</p> <p>11: COS3, COS2, COS1 and COS0 are in strict priority.</p> <p>Strict priority: When it is in strict priority, the priority is COS3 > COS2 > COS1 > COS0.</p> <p>The G_TXPORT will always serve the higher queue first if it is not empty.</p> <p>In this mode, the service weight are don't care.</p> <p>Weighted round robin: When it is in weighted round robin mode, the queues are scheduled in a round robin way according to the service weight of each queue.</p>	00

See "Quality of Service" on page 34 for more information.

TX Queue Weight Register (Page 30h: Address 81h)

Table 189: TX Queue Weight Register Queue[0:3] (Page 30h: Address 81h–84h)

Bit	Name	R/W	Description	Default
7:0	QSERV_WEIGHT	R/W	<p>Queue weight register</p> <p>The binary value of these bits sets the service weight of the given queue. The value of 1 allows the queue to send one packet for every round; the value of 4 allows the queue to send four packets for every round. It is suggested that the weight of each queue be $Q3 > Q2 > Q1 > Q0 > 0$.</p> <p>Note: The maximum allowable transmit queue weight is 31h. Programming a higher weight than 31h can yield unexpected results. This field must not be programmed as zero.</p>	<p>Queue:</p> <p>0: 0001</p> <p>1: 0010</p> <p>2: 0100</p> <p>3: 1000</p>

See "Quality of Service" on page 34 for more information.

COS4 Service Weight Register (Page 30h: Address 85h–86h)

Table 190: COS4 Service Weight Register (Page 30h: Address 85h–86h)

Blk	Name	R/W	Description	Default
15:9	Reserved	RO	Reserved	0
8	COS4 Strict Priority	R/W	COS4 Strict Priority When this field is set to '1', the C4 service weight is don't care and Class 4 is in strict priority over the best effort queues (COS3–COS0).	1
7:0	COS4 Weight	R/W	COS4 Service Weight This field defines the service weight between Class 4 traffic and the Best Effort COS3-COS0. When this field is N, it means Class-4:Best-Effort = N:1 When in weighted round robin mode, it is meaningless to set this field as zero.	1

Page 31h: Port-Based VLAN Registers

Global VLAN Control 3 Register (Page 34h: Address 03h)

Table 202: Global VLAN Control 3 Register (Page 34h: Address 03h–04h)

Bit	Name	R/W	Description	Default
15:9	Reserved	RO	–	–
7:0	Drop Non1Q Frames	R/W	Drop non1Q frames When enabled, any frame without an IEEE 802.1Q tag is dropped by this port. This field does not apply to IMP port. Bit 8: IMP port Bits [7:0] correspond to ports [7:0], respectively.	0

Global VLAN Control 4 Register (Page 34h: Address 05h)

Table 203: Global VLAN Control 4 Register (Page 34h: Address 05h)

Bit	Name	R/W	Description	Default
7:6	Source Membership Check	R/W	Source membership check bit Frames with a VID matching a corresponding entry in the VLAN table can be checked for source membership. The source is a member only when the source address of the frame is included as a member in the corresponding VLAN entry. 00 = Forward frame, but do not learn the SA into the ARL table. 01 = Drop frame. 10 = Forward frame, and learn the SA into the ARL table. 11 = Forward frame to IMP, but not learn. Note: Does not apply to IMP port.	11
5	Forward GVRP to Management	R/W	Forward all GVRP frames to the frame management port bit. 1 = GVRP frames are forwarded to the management port. 0 = GVRP frames are not forwarded to the management port.	0
4	Forward GMRP to Management	R/W	Forward All GMRP Frames to the frame management port bit. 1 = GMRP frames are forwarded to the management port. 0 = GMRP frames are not forwarded to the management port.	0
3:2	En_DT_Mode	R/W	00 = Disable double tagging mode 01 = Enable DT_Mode (double tagging mode) 10 = Reserved 11 = Reserved	2'b00
1	RSV_MCAST_FLOOD	R/W	When the BCM53128 is configured to operate in double tag feature management mode. 1 = Flood (including all data port and CPU), reserved mcast is based on the VLAN rule. 0 = Trap reserved mcast to CPU. Reserved mcast include: 01-80-C2-00-00-(00,02~2F)	
0	Reserved	R/W	Reserved	0

For more information, see [“IEEE 802.1Q VLAN” on page 39](#).

Global VLAN Control 5 Register (Page 34h: Address 06h)

Table 204: Global VLAN Control 5 Register (Page 34h: Address 06h)

Bit	Name	R/W	Description	Default
7	Reserved	R/W	Reserved	0
6	Tag Status Preserve	R/W	IEEE 802.1Q tag/untag status preserved at egress. 0 1 = Regardless of untag map in VLAN table, non-1Q frames (including 802.1p frames) will not be changed at TX (egress). This field has no effect in double tagging mode (DT_Mode).	0
5	Reserved	R/W	Reserved	0
4	Trunk Check Bypass	R/W	Trunk check bypass 1 = Egress directed frames issued from the IMP port bypass trunk checking. 0 = Egress directed frames issued from the IMP port are subject to trunk checking and redirection.	1
3	Drop Invalid VID	R/W	Drop frames with invalid VID. Frames with an invalid VID do not have a corresponding entry in the VLAN table. 1 = Ingress frames with invalid VID are dropped. 0 = Ingress frames with invalid VID are forwarded to the IMP port.	0
2	VID_FFF_Fwding	R/W	Enable VID FFF forward 1 = Forward frame 0 = Comply with standard, drop frame	0
1	Reserved	R/W	Reserved	0
0	Management CRC Check Bypass	R/W	Bypass CRC check at the frame management port. 1 = Ignore CRC check 0 = Check CRC	0

For more information, see [“IEEE 802.1Q VLAN” on page 39](#).

VLAN Multiport Address Control Register (Page 34h: Address 0Ah–0Bh)

Table 205: VLAN Multiport Address Control Register (Page 34h: Address 0Ah–0Bh)

Bit	Name	R/W	Description	Default
15:12	Reserved	RO	Reserved	0
11	EN_MPORT5_untagmap	R/W	When set to 1, MPORT_ADD5 is checked by VLAN untag map. Note: Does not apply to the frame management port.	0
10	EN_MPORT5_fwdmap	R/W	When set to 1, MPORT_ADD5 is checked by VLAN forward map. Note: Does not apply to the frame management port.	0
9	EN_MPORT4_untagmap	R/W	When set to 1, MPORT_ADD4 will be checked by VLAN untag map. Note: Does not apply to the frame management port.	0
8	EN_MPORT4_fwdmap	R/W	When set to 1, MPORT_ADD4 will be checked by VLAN forward map. Note: Does not apply to the frame management port.	0
7	EN_MPORT3_untagmap	R/W	When set to 1, MPORT_ADD3 will be checked by VLAN untag map. Note: Does not apply to the frame management port.	0
6	EN_MPORT3_fwdmap	R/W	When set to 1, MPORT_ADD3 will be checked by VLAN forward map. Note: Does not apply to the frame management port.	0
5	EN_MPORT2_untagmap	R/W	When set to 1, MPORT_ADD2 will be checked by VLAN untag map. Note: Does not apply to the frame management port.	0
4	EN_MPORT2_fwdmap	R/W	When set to 1, MPORT_ADD2 will be checked by VLAN forward map. Note: Does not apply to the frame management port.	0
3	EN_MPORT1_untagmap	R/W	When set to 1, MPORT_ADD1 will be checked by VLAN untag map. Note: Does not apply to the frame management port.	0
2	EN_MPORT1_fwdmap	R/W	When set to 1, MPORT_ADD1 will be checked by VLAN forward map. Note: Does not apply to the frame management port.	0

Table 205: VLAN Multiport Address Control Register (Page 34h: Address 0Ah–0Bh) (Cont.)

Bit	Name	R/W	Description	Default
1	EN_MPORT0_untagmap	R/W	When set to 1, MPORT_ADD0 will be checked by VLAN untag map. Note: Does not apply to the frame management port.	0
0	EN_MPORT0_fwdmap	R/W	When set to 1, MPORT_ADD0 will be checked by VLAN forward map. Note: Does not apply to the frame management port.	0

Default IEEE 802.1Q Tag Register (Page 34h: Address 10h)

Table 206: Default IEEE 802.1Q Tag Register Address Summary

Address	Description
10h–11h	Port 0
12h–13h	Port 1
14h–15h	Port 2
16h–17h	Port 3
18h–19h	Port 4
1Ah–1Bh	Port 5
1Ch–1Dh	Port 6
1Eh–1Fh	Port 7
20h–21h	IMP port

Table 207: Default IEEE 802.1Q Tag Register (Page 34h: Address 10h–21h)

Bit	Name	R/W	Description	Default
15:13	DEFAULT_PRI/ PORT_QOS_PRI	R/W	Default IEEE 802.1Q priority If an IEEE 802.1Q tag is added to an incoming untagged frame (IEEE 802.1Q VLAN or Double-Tagging enabled), these bits are the default priority value for the new tag. See “IEEE 802.1Q VLAN” on page 39 and “Double-Tagging” on page 41 for more information. Port-based QoS priority map bits When port-based QoS is enabled in the Table : “QoS Global Control Register (Page 30h: Address 00h)” on page 236 , these bits represent the TC for the ingress port. The TC determines the TX queue for each frame based on the “TC_To_COS Mapping Register (Page 30h: Address 62h–63h)” on page 241 .	000
12	CFI	R/W	Conical form indicator	0

Table 207: Default IEEE 802.1Q Tag Register (Page 34h: Address 10h–21h) (Cont.)

Bit	Name	R/W	Description	Default
11:0	DEFAULT_VID	R/W	Default IEEE 802.1Q VLAN ID If an IEEE 802.1Q tag is tagged to an incoming non-IEEE 802.1Q frame (IEEE 802.1Q VLAN or Double-Tagging enabled), then these bits are the default VID for the new tag. See “IEEE 802.1Q VLAN” on page 39 and “Double-Tagging” on page 41 for more information.	001

Address	Description
C0h	IMP Port

Table 226: IMP Port Egress Rate Control Configuration Registers (Page 41h: Address C0h)

Blk	Name	R/W	Description	Default
7:6	RESERVED	RO	Reserved	0
5:0	Rate_Index	R/W	Rate_Index is used to configure different egress rates for IMP in packet per second (pps). See Table 227: “Using Rate_Index to Configure Different Egress Rates for IMP in pps,” on page 268. When set to 0, the egress rate is limited to a maximum of 384 pps. When set to 63, the egress rate control function is disabled and all packets are transmitted at wire-speed. Note: If the Rate_Index is configured as a certain value, the egress rate is limited to the corresponding speed whether the switch is running at 10 Mbps, 100 Mbps, or 1 Gbps. Note: The Rate_Index should be a reasonable value under the corresponding network speed configuration. It does not make sense to set a value of 63 with the network configuration at 10 Mbps. In that case, the egress rate is limited up to 10 Mbps.	6'd63

BroadSync HD Enable Control Register (Page 90h: Address 00h–01h)

Table 253: BroadSync HD Enable Control Register (Page 90h: Address 00h–01h)

Bit	Name	R/W	Description	Default
15:8	Reserved	RO	Reserved	0
7:0	BroadSync HD Enable	R/W	BroadSync HD enable. Bits [7:0] correspond to ports [7:0]	0

BroadSync HD Time Stamp Report Control Register (Page 90h: Address 02h)

Table 254: BroadSync HD Time Stamp Report Control Register (Page 90h: Address 02h)

Bit	Name	R/W	Description	Default
7:1	Reserved	RO	Reserved	0
0	TSRPT_PKT_EN	R/W	This field is to allow the Time Stamp Reporting Packet to IMP port when the time synchronization packet transmitted on egress port.	0

BroadSync HD PCP Value Control Register (Page 90h: Address 03h)

Table 255: BroadSync HD PCP Value Control Register (Page 90h: Address 03h)

Bit	Name	R/W	Description	Default
7:6	Reserved	RO	Reserved	0
5:3	ClassB_PCP	R/W	BroadSync HD Class B PCP value. This field is used to qualify the PCP value of BroadSync HD packet. This BroadSync HD packet will be sent to Queue4.	3'd4
2:0	ClassA_PCP	R/W	BroadSync HD Class A PCP value. This field is used to qualify the PCP value of BroadSync HD packet. This BroadSync HD packet will be sent to Queue5.	3'd5

BroadSync HD Max Packet Size Register (Page 90h: Address 04h)

Table 256: BroadSync HD Max Packet Size Register (Page 90h: Address 04h)

Blk	Name	R/W	Description	Default
15:12	Reserved	RO	Reserved	0
11:0	MAX_BroadSync HD_PACKET_SIZE	R/W	This field is to define the max packet size of BroadSync HD. The ingress port uses it to qualify if the packet is allowed to pass through a BroadSync HD link. The egress port uses it to perform shaping gate.	12'd1518

BroadSync HD Time Base Register (Page 90h: Address 10h–13h)

Table 257: BroadSync HD Time Base Register (Page 90h: Address 10h–13h)

Blk	Name	R/W	Description	Default
31:0	TIME BASE	RO	Time Base This is a 32-bit free running clock (running at 25 MHz) for BroadSync HD time base. Ingress port and Egress port use it for Time Synchronization Packet Time Stamp.	0

BroadSync HD Time Base Adjustment Register (Page 90h: Address 14h–17h)

Table 258: BroadSync HD Time Base Adjustment Register (Page 90h: Address 14h–17h)

Blk	Name	R/W	Description	Default
31:12	Reserved	RO	Reserved	0
11:8	TIME ADJUST PERIOD	R/W	Time Adjust Period This field defines the tick numbers to apply the adjusted Time Increment (when Time Increment does not equal to 40). For example, to increment the Time Base for 10 ticks with 41 ns per tick, Time Adjust Period is 10, and Time Increment is 41.	41. 4'h0
7:6	Reserved	RO	Reserved	0
5:0	TIME INCREMENT	R/W	Time Increment This field defines the value to add into Time Base in each 25-MHz tick. Default is 40.	6'd40

BroadSync HD Slot Number and Tick Counter Register (Page 90h: Address 18h–1Bh)

Table 259: BroadSync HD Slot Number and Tick Counter Register (Page 90h: Address 18h–1Bh)

Blk	Name	R/W	Description	Default
31:28	Reserved	RO	Reserved	0
27:16	TICK COUNTER	R/W	Tick Counter This is the tick counter which defines when will Slot Number increment. It runs from 1 to 3125 (or 3124, or 3126, depends on “BroadSync HD Slot Number and Tick Counter Register (Page 90h: Address 18h–1Bh)” on page 282 setting) under 25 MHz.	12'h0
15:5	Reserved	RO	Reserved	0
4:0	SLOT NUMBER	R/W	This field specifies the Slot Number for BroadSync HD.	8'h0

BroadSync HD Slot Adjustment Register (Page 90h: Address 1Ch–1Fh)

Table 260: BroadSync HD Slot Adjustment Register (Page 90h: Address 1Ch–1Fh)

Blk	Name	R/W	Description	Default
31:18	Reserved	RO	Reserved	0
17:16	MACRO SLOT PERIOD	R/W	Macro Slot Period This field defines the slot time of a macro slot for Class 4 traffic. 00 = 1 ms 01 = 2 ms 10 = 4 ms 11 = Reserved Class 5 traffic slot time is always 125s period.	2'h0
15:12	Reserved	RO	Reserved	0
11:8	SLOT ADJUST PERIOD	R/W	Slot Adjust Period This field defines the number of slots to apply the alterable slot adjustment.	8'h0
7:2	Reserved	RO	Reserved	0
1:0	SLOT ADJUSTMENT	R/W	Slot Adjustment This field defines when the slot number counter increment by 1. Default is 40. 00 = Slot Number increased by 1 when tick counter rolls over 3125. 01 = 3126 10 = 3124 11 = Reserved	2'h0

BroadSync HD Class 5 Bandwidth Control Register (Page 90h: Address 30h)

Table 261: BroadSync HD Class 5 Bandwidth Control Register Address Summary

Address	Description
30h–31h	Port 0
32h–33h	Port 1
34h–35h	Port 2
36h–37h	Port 3
38h–39h	Port 4

3Ch–3Dh	Port 6
3Eh–3Fh	Port 7

Table 262: BroadSync HD Class 5 Bandwidth Control Register (Page 90h: Address 30h–31h, 32h–33h, 34h–35h, 36h–37h, 38h–39h)

Bit	Name	R/W	Description	Default
15	C5_WINDOW	R/W	The purpose is to control the credit carry-over under different link speed. For a 100M link, the 125- μ s slot is too small such that BroadSync HD packet could easily “slip slot”, so the credit carry-over should be allowed. For a 1G link, 125- μ s slot is reasonably big such that the BW reservation could be done in a conservative way to prevent “slot slipping”, so credit carry-over is not needed.	1'b0
14	Reserved	RO	Reserved	0
13:0	C5_BANDWIDTH	R/W	This field defines the byte count allowed for Class 5 traffic transmission within a slot time.	14'h0

Section 8: Electrical Characteristics

Absolute Maximum Ratings

Table 298: Absolute Maximum Ratings

Symbol	Parameter and Pins	Minimum	Maximum	Units
–	Supply voltage: PLL_AVDD, DVDD, AVDDL	GND–0.3	1.32	V
–	Supply voltage: OVDD2, AVDDH, OVDD, XTAL_AVDD	GND–0.3	3.63	V
I_I	Input current	–	–	mA
T_{STG}	Storage temperature	–40	+125	°C
V_{ESD}	Electrostatic discharge	–	2000	V
–	Input voltage: digital input pins	–	–	V

Note: These specifications indicate levels where permanent damage to the device may occur. Functional operation is not guaranteed under these conditions. Operation at absolute maximum conditions for extended periods may adversely affect long-term reliability of the device.

Recommended Operating Conditions

Table 299: Recommended Operating Conditions

Symbol	Parameter	Pins	Minimum	Maximum	Units
VDD	Supply voltage	AVDDL, DVDD, PLL_AVDD	1.14	1.26	V
		OVDD2, AVDDH, XTAL_AVDD	3.14	3.47	V
		–	–	–	V
		–	–	–	V
V_{IH}	High-level input voltage	All digital inputs	2.0	–	V
V_{IL}	Low-level input voltage	All digital inputs	–	0.8	V
T_A	Ambient operating temperature	–	0	70	°C

Electrical Characteristics

Table 300: Electrical Characteristics

Symbol	Parameter	Pins	Conditions	Minimum	Typical	Maximum	Units
I_{DD}	Maximum supply current (for GMII/RvMII/MII operation)	1.2V power rail	Estimated	—	1130	—	mA
		3.3V power rail	Estimated	—	496	—	mA
		OVDD (3.3V for GMII/RvMII/MII)	Estimated	—	36	—	mA
I_{DD}	Maximum supply current (for RGMII operation)	1.2V power rail	Estimated	—	1130	—	mA
		3.3V power rail	Estimated	—	496	—	mA
		2.5V power rail	Estimated	—	26	—	mA
		1.5V power rail	—	—	—	—	mA
V_{OH}	High-level output voltage	Digital output pins at 3.3V	$I_{OH} = -8\text{ mA}$	2.1	—	—	V
		Digital output pins at 2.5V	$I_{OH} = -8\text{ mA}$	2.0	—	—	V
		Digital output pins at 1.5V	$I_{OH} = -8\text{ mA}$	1.1	—	—	V
V_{OL}	Low-level output voltage	Digital output pins at 3.3V	$I_{OL} = 8\text{ mA}$	—	—	0.5	V
		Digital output pins at 2.5V	$I_{OL} = 8\text{ mA}$	—	—	0.4	V
		Digital output pins at 1.5V	$I_{OL} = 8\text{ mA}$	—	—	0.4	V
V_{IH}	High-level input voltage	Digital input pins at 3.3V and 2.5V	—	1.7	—	—	V
		Digital input pins at 1.5V	—	0.85	—	—	V
		XTALI	—	2.0	—	—	V
V_{IL}	Low-level input voltage	Digital input pins at 3.3V	—	—	—	0.9	V
		Digital input pins at 2.5V	—	—	—	0.7	V
		Digital input pins at 1.5V	—	—	—	0.65	V
		XTALI	—	—	—	0.8	V
I_I	Input current	Digital inputs w/ pull-up resistors	—	—	—	—	μA
		Digital inputs w/ pull-up resistors	—	—	—	—	μA
		Digital inputs w/ pull-down resistors	—	—	—	—	μA
		Digital inputs w/ pull-down resistors	—	—	—	—	μA
		All other digital inputs	—	—	—	—	μA

Section 9: Timing Characteristics

Reset and Clock Timing

Figure 49: Reset and Clock Timing

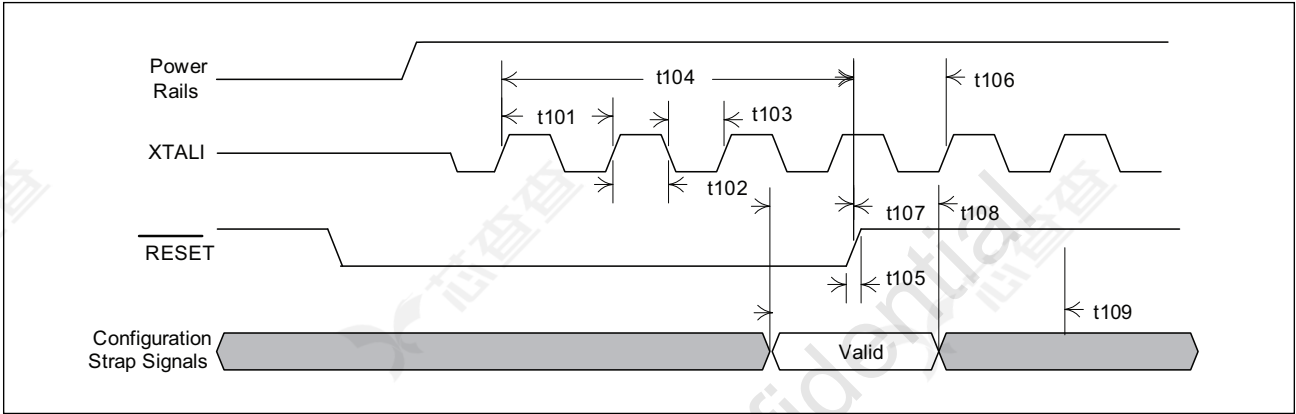

Table 301: Reset and Clock Timing

Description	Parameter	Minimum	Typical	Maximum
XTALI period	t101	39.998 ns	40 ns	40.002 ns
XTALI high time	t102	18 ns	—	22 ns
XTALI low time	t103	18 ns	—	22 ns
RESET low pulse duration	t104	80 ms	100 ms	—
RESET rise time	t105	—	—	25 ns
Configuration valid setup to RESET rising	t107	100 ns	—	—
Configuration valid hold from RESET rising	t108	—	—	100 ns
Hardware initialization is complete. All the strap pin values are clocked in, and the internal registers can be accessed.	t109	5 ms before the registers can be accessed		

MII Interface Timing

The following specifies timing information regarding the MII Interface pins.

MII Input Timing

Figure 50: MII Input

Table 302: MII Input Timing

Parameter	Description	Min	Typ	Max
t401	RXDV, RXD, to RXC rising setup time	10 ns	—	—
t402	RXC clock period (10BASE-T mode)	—	400 ns	—
	RXC clock period (100BASE-TX mode)	—	40 ns	—
t403	RXC high/low time (10BASE-T mode)	160 ns	—	240 ns
	RXC high/low time (100BASE-TX mode)	16 ns	—	24 ns
t404	RXDV, RXD, to RXC rising hold time	10 ns	—	—
—	Duty cycle	—	—	—

MII Output Timing

Figure 51: MII Output Timing

Table 303: MII Output Timing

Parameter	Description	Min	Typ	Max
t405	TXC high to TXEN, TXD valid	0 ns	–	25 ns
t406	TXC high to TXEN, TXD invalid (hold)	0 ns	–	–

TMII Interface Timing

The following specifies timing information regarding the TMII Interface pins.

TMII Input Timing

Figure 52: TMII Input

Table 304: TMII Input Timing

Parameter	Description	Min	Typ	Max
t401	RXDV, RXD, to RXC rising setup time	5 ns	–	–
t402	RXC clock period (100BASE-TX mode)	–	20 ns	–
t403	RXC high/low time (100BASE-TX mode)	8 ns	–	12 ns
t404	RXDV, RXD, to RXC rising hold time	5 ns	–	–
–	Duty cycle	–	–	–

TMII Output Timing

Figure 53: TMII Output Timing

Table 305: TMII Output Timing

Parameter	Description	Min	Typ	Max
t405	TXC high to TXEN, TXD valid	0 ns	–	12.5 ns
t406	TXC high to TXEN, TXD invalid (hold)	0 ns	–	–

Reverse MII/TMII Interface Timing

The following specifies timing information regarding the Reverse MII/TMII Interface pins.

Reverse MII/TMII Input Timing

Figure 54: Reverse MII Input Timing

Table 306: Reverse MII Input Timing

Description	Parameter	Min	Typ	Max	Units
RXDV, RXD to RXC rising setup time	t401R	10	–	–	ns

Table 306: Reverse MII Input Timing

Description	Parameter	Min	Typ	Max	Units
RXC (output) clock period (10BASE-T mode)	t402R	–	400	–	ns
RXC clock period (100BASE-TX mode)		–	40	–	ns
RXC high/low time (10BASE-T mode)	t403R	160	–	240	ns
RXC high/low time (100BASE-TX mode)		16	–	24	ns
RXDV, RXD to RXC rising hold time	t404R	0	–	–	ns

Table 307: Reverse TMII Input Timing

Description	Parameter	Min	Typ	Max	Units
RXDV, RXD to RXC rising setup time	t401R	7.5	–	–	ns
RXC (output) clock period	t402R	–	20	–	ns
RXC high/low time (10BASE-T mode)	t403R	8	–	12	ns
RXDV, RXD to RXC rising hold time	t404R	0	–	–	ns

Reverse MII Output Timing

Figure 55: Reverse MII Output Timing**Table 308: Reverse MII Output Timing**

Description	Parameter	Min	Typ	Max	Units
Output (TXD, TX_EN) setup to TXC rising	t405R	15	–	25	ns
Output (TXD, TX_EN) hold from TXC rising	t406R	11	–	–	ns
TXC clock period	t407R	–	40	–	ns
TXC high/low time	t408R	15	–	22	ns

Table 309: Reverse TMII Output Timing

Description	Parameter	Min	Typ	Max	Units
Output (TXD, TX_EN) setup to TXC rising	t405R	5	–	–	ns

Table 309: Reverse TMII Output Timing

Description	Parameter	Min	Typ	Max	Units
Output (TXD, TX_EN) hold from TXC rising	t406R	5	—	—	ns
TXC clock period	t407R	—	20	—	ns
TXC high/low time	t408R	7.5	—	11	ns

RGMII Interface Timing

The following specifies timing information regarding the IMP interface pins when configured in RGMII mode.

RGMII Output Timing (Normal Mode)

Figure 56: RGMII Output Timing (Normal Mode)**Table 310: RGMII Output Timing (Normal Mode)**

Description	Parameter	Min	Typ	Max	Units
GTX_CLK clock period (1000M mode)	—	7.2	8	8.8	ns
GTX_CLK clock period (100M mode)	—	36	40	44	ns
GTX_CLK clock period (10M mode)	—	360	400	440	ns
TskewT: data to clock output skew	t201	–500 (1000M)	0	+500 (1000M)	ps
Duty cycle for 1000M (GE)	—	45	50	55	%
Duty cycle for 10/100M (FE)	—	40	50	60	%

Note: The output timing in 10/100M operation is always as specified in the delayed mode.

RGMII Output Timing (Delayed Mode)

RGMII output timing defaults to the delayed mode when the TXC_DELAY pin is pulled high at power-on reset.

Figure 57: RGMII Output Timing (Delayed Mode)

Table 311: RGMII Output Timing (Delayed Mode)

Description	Parameter	Min	Typ	Max	Units
GTX_CLK clock period (1000M mode)	—	7.2	8	8.8	ns
GTX_CLK clock period (100M mode)	—	36	40	44	ns
GTX_CLK clock period (10M mode)	—	360	400	440	ns
TsetupT Data valid to clock transition: Available setup time at the output source (delayed mode)	t201D	1.2 (all speeds)	2.0	—	ns
TholdT Clock transition to data valid: Available hold time at the output source (delayed mode)	t202D	1.2	2.0	—	ns
Duty cycle for 1000M (GE)	—	45	50	55	%
Duty cycle for 10/100M (FE)	—	40	50	60	%

RGMII Input Timing (Normal Mode)

Figure 58: RGMII Input Timing (Normal Mode)

Table 312: RGMII Input Timing (Normal Mode)

Description	Parameter	Min	Typ	Max	Units
RXCLK clock period (1000M mode)	—	7.2	8	8.8	ns
RXCLK clock period (100M mode)	—	36	40	44	ns
RXCLK clock period (10M mode)	—	360	400	440	ns
TsetupR Input setup time: valid data to clock	t301	1.0	2.0	—	ns
TholdR Input hold time: clock to valid data	t302	1.0	2.0	—	ns
Duty cycle for 1000M (GE)	—	45	50	55	%
Duty cycle for 10/100M (FE)	—	40	50	60	%

RGMII Input Timing (Delayed Mode)

RGMII Input Timing defaults to the delayed mode when the RXC_DELAY pin is pulled high at power-on reset.

Figure 59: RGMII Input Timing (Delayed Mode)

Table 313: RGMII Input Timing (Delayed Mode)

Description	Parameter	Min	Typ	Max	Units
TsetupR	t301D	-1.0 (1000M)	-	-	ns
Input setup time (delayed mode)		-1.0 (10/100M)	-	-	ns
TholdR	t302D	3.0 (1000M)	-	-	ns
Input hold time (delayed mode)		9.0 (10/100M)	-	-	ns

GMII Interface Timing

The following specifies timing information regarding the IMP interface pins when configured in GMII mode.

GMII Interface Output Timing

Figure 60: GMII Output Timings

Table 314: GMII Output Timing

Description	Parameter	Min	Typ	Max	Units
GTX_CLK clock period (1000M mode)	–	7.5	8	8.5	ns
Output (TXD, TX_EN) setup to GTX_CLK rising	t501	2.5	–	–	ns
Output (TXD, TX_EN) hold from GTX_CLK rising	t502	0.5	–	5.5	ns

GMII Interface Input Timing

Figure 61: GMII Input Timings

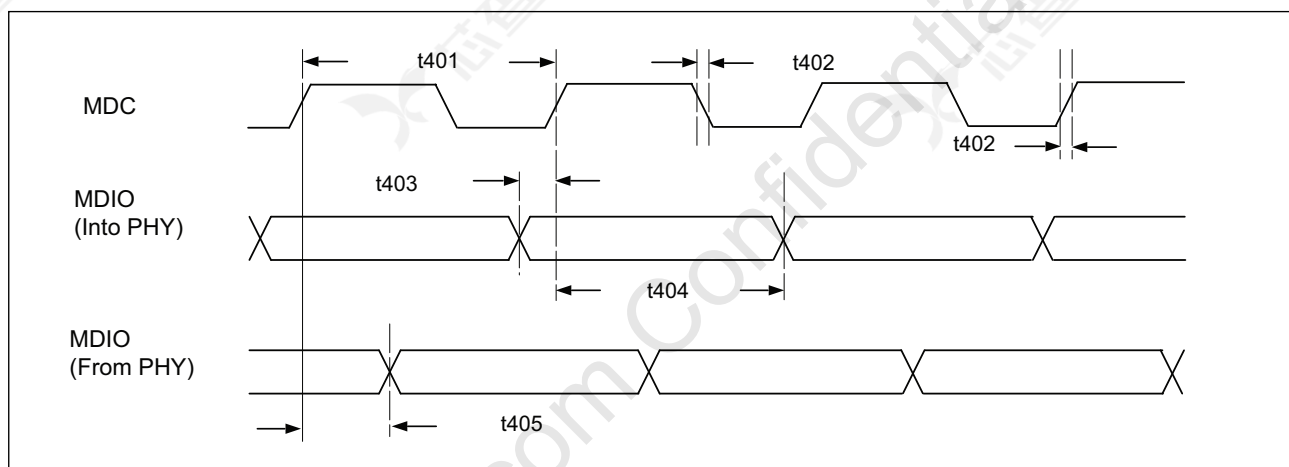

Table 315: GMII Input Timing

Description	Parameter	Min	Typ	Max	Units
RXCLK clock period (1000M mode)	—	—	8	—	ns
(RXD, RX_DV) Setup to RX_CLK rising	t503	2.0	—	—	ns
(RXD, RX_DV) Hold from RX_CLK rising	t504	0.0	—	—	ns

MDC/MDIO Timing

The following specifies timing information regarding the MDC/MDIO interface pins.

Figure 62: MDC/MDIO Timing (Slave Mode)**Table 316: MDC/MDIO Timing (Slave Mode)**

Description	Parameter	Minimum	Typical	Maximum	Unit
MDC cycle time	t401	80	—	—	ns
MDC high/low	—	30	—	—	ns
MDC rise/fall time	t402	—	—	10	ns
MDIO input setup time to MDC rising	t403	7.5	—	—	ns
MDIO input hold time from MDC rising	t404	7.5	—	—	ns
MDIO output delay from MDC rising	t405	0	—	45	ns

Table 317: MDC/MDIO Timing (Master Mode)

Description	Parameter	Minimum	Typical	Maximum	Unit
MDC cycle time	t401	400	—	—	ns
MDC high/low	—	160	—	240	ns

Table 317: MDC/MDIO Timing (Master Mode)

Description	Parameter	Minimum	Typical	Maximum	Unit
MDC rise/fall time	t402	—	—	10	ns
MDIO input setup time to MDC rising	t403	80	—	—	ns
MDIO input hold time from MDC rising	t404	0	—	—	ns
MDIO output delay from MDC rising	t405	15	—	90	ns

Serial LED Interface Timing

The following specifies timing information regarding the LED interface pins.

Figure 63: Serial LED Interface Timing

Table 318: Serial LED Interface Timing

Description	Parameter	Minimum	Typical	Maximum	Unit
LED update cycle period	t301	—	42	—	ms
LEDCLK period	t302	—	320	—	ns
LEDCLK high-pulse width	t303	150	—	170	ns
LEDCLK low-pulse width	t304	150	—	170	ns
LEDCLK to LEDDATA output time	t305	140	—	180	ns

SPI Timings

Figure 64: SPI Timings, \overline{SS} Asserted During SCK High

Note: Advanced timing extracted from statistical data. It may or may not reflect the true timing of the device.

Table 319: SPI Timings

Description	Parameter	Minimum	Typical	Maximum
SCK clock period	t601	40 ns	500 ns	—
SCK high/low time	t602	20 ns	—	—
MOSI to SCK setup time	t603	5 ns	—	—
MOSI to SCK hold time	t604	5 ns	—	—
SCK to MISO valid	t605	—	—	13 ns
\overline{SS} to MISO invalid	t606	—	—	10 ns
Time interval from assert of \overline{SS} to beginning the operation of SCK	t607	10 ns	—	—
Time interval from operation end of SCK to de-assert of \overline{SS}	t608	20 ns	—	—

EEPROM Timing

Figure 65: EEPROM Timing

Table 320: EEPROM Timing

Description	Parameter	Minimum	Typical	Maximum
SCK clock frequency	t701	–	200 kHz	–
SCK high/low time	t702	–	2.5 μ s	–
MISO to SCK rising setup time	t703	50 ns	–	–
MISO to SCK rising hold time	t704	10 ns	–	–
SCK low to \overline{SS} , MOSI valid time	t705	30 ns	–	100 ns
SCK low to \overline{SS} , MOSI invalid time	t706	30 ns	–	–

Serial Flash Timing

Figure 66: Serial Flash Timing

Table 321: Serial Flash Timing

Description	Parameter	Minimum	Typical	Maximum
FSClk clock frequency	t801	–	22.72 MHz	50 MHz
FSI to FSClk rising setup time	t802	10 ns	–	–
FSI to FSClk rising hold time	t803	0 ns	–	–
FSClk to FSO delay	t804	5 ns	–	FSClk cycle time - 5 ns
The falling edge of FCSB to first rising edge of FSClk	t805	5 ns	–	–
The last rising edge of FSClk to rising edge of FCSB	t806	5 ns	–	–

Section 10: Thermal Characteristics

Note: The maximum allowed junction temperature is 125 °C. [Table 322](#) and [Table 323](#) on page 314 show the estimated junction temperature with heat sink.

Table 322: BCM53128KQLE Package without Heat Sink, 4-Layer Board, P = 3.1W
